defrost. To remove the frost deposited around the ice

compartment of pechanical refrigerator. (-1940)

de-gaussing girdle. (de + gauss), unit of magnetic flux density, named for Carl Friedrich Gauss, German scientist and mathematician, + ing.) A special girdle of electric cables, placed around the hull of a ship, carrying a certain kind of electricity which neutralizes the magnetic field set up by the metal of the ship and thus renders magnetic mines ineffective. degaussisation, n.

Dendroica Potomac. A new species of warbler discovered by Karl W. Haller. Also called Sutton's Warbler.

dive bombing. Bombing at the end of a long, steep dive during which the plane is pointed at the target. droop, n. Slang. An undesirable, unattractive person.

Dunkirk throat. A sore throat, accompanied by hoarseness.

E-boat. (Brit.) Slang. Short for enemy boat, a German motor torpedo boat.

egg, to lay an. Slang. To attempt a joke, usually in commercial entertainment, that does not come off.

ferry, v. To fly an aeroplane to the purchaser. American planes were ferried across the Atlantic ocean for the British. ferryman, n.

fireblitzed, adj. (Brit.) Pertaining to a severely bombed area.

first termer. A public officeholder serving his first term. flare-blitz. (Brit.) A blitz of flares rather than bombs dropped from nazi aircraft.

flat-footed, to catch. To catch one unprepared, or without proper defenses, or preparations.

flight deliver, v. To deliver a plane to a purchaser by flying it to him.

ghost town. A town economically dead as a result of the removal of all important sources of livelihood. (-1940)

Hollywood, to go. Slang. To praise oneself openly. horse (or horsed) cavalry. That part of the caval

horse (or horsed) cavalry. That part of the cavalry employing horses as contrasted with that using motorized equipment.

incendiary, n. Short for incendiary bomb.

iffy, adj. Uncertain, dubious, contingent.

intercom. Short for intercommunication, the telephone system in an aeroplane.

Jaycee. A member of the U.S. Junior Chamber of Commerce. (-1940)

Joad. The name of the family of migratory labourers in John Steinbeck's *The Grapes of Wrath*; hence, any migratory labourer. Usually plural.

Killick. Naval Slang. Petty officer, so called from the killick (anchor) on his sleeve. (-1940)

know-how, n. The technical knowledge and skill to carry out a given project.

L.D.V. British Local Defense volunteers.

Lebensraum, n. (Ger. living space.) Land necessary to the self-sufficiency of the nazi state.

Luftwaffe (pl. Luftwaffen). (Ger. Luft, air + Waffe, weapon.) The air force of Germany. (-1940)

Mae West. A life preserver.

man-tailored, adj. Pertaining to women's clothes, tailored like those of a man.

Me. Short for Messerschmitt, German fighter plane.

Molotov breadbasket. A large bomb, taller than a man, so designed as to release 20 to 30 small incendiary bombs. In one type, the fire bombs were ejected by the explosion when the bomb struck the ground; in the other, the incendiaries were released by a mechanism after the breadbasket had fallen for some distance; named for Russian Foreign Minister Molotov during the "winter war" in Finland, 1939–40.

Molotov cocktail. A hand-grenade improvised from an

empty bottle, which is filled with gasoline, fuel oil, or the like, corked, and supplied with a wick which acts as a fuse.

Mona. (Brit.) Name given the air raid signal by Londoners.

muck. (Slang.) Gunfire.

Munichism. Mental state similar to that of Munich, when Hitler was appeased.

name calling. A technique, esp. used in propaganda, of setting up an attitude toward a person (or thing) by applying to him (or it) a word with the desired (usually derogatory) connotations. (-1940)

near miss. A miss by a bomb, which yet strikes so near the target that damage is inflicted.

newsworthy. Pertaining to what has news value. (-1940) Nylons. Short for Nylon hose.

Okie. A migratory farmer, so called because from Oklahoma. (1939)

Panzer column, division. (Ger. armour.) An armoured, highly mechanized and mobile division of troops used in conjunction with the air arm in the German blitzkrieg. parachuter. A parachutist.

paratrooper, n. & adj. A fully armed infantryman parachuted behind enemy lines.

parashooter. (Brit.) Civilian volunteer trained to shoot enemy paratroops. Also parashootist, parashot, paraspotter.

party-liner. One who follows his political party very closely in his views and voting.

Paul Pry. (Brit.) Slang. A tremendous searchlight. peashooter. (Brit.) Slang. A pursuit plane.

peel off, v. To leave a formation of aircraft in a steep bank preparatory to taking up an individual position for a mission

pep pill. A benzedrine tablet. (-1940)

P. E. T. N. Short for pentaerythritol tetranitrate, an extremely powerful explosive.

phantom limb. An amputated limb which the amputee imagines he can still feel.

plastic. Anything fashioned from plastic material.

pollee. One questioned in a poll, such as a Gallup poll. possible, n. A plane possibly shot down.

powder, take a. Slang. To make off, go away, disappear, vanish.

pratfall, v. To fall backward, esp. on the buttocks. prefabricator. A producer of prefabricated units, esp. houses.

priority. A prior claim, esp. on strategic materials, given by a government board to manufacturers of products necessary in war.

PT boat. A motor torpedo boat.

quisle, v. To betray, be a traitor, or a Quisling.

Quisling. A traitor; so called from the treachery of Maj. Vidkum Quisling, founder and head of the nazi party in Norway, who assumed headship of the puppet administration set up by the Germans after their successful occupation of Norway. Also quisler.

radiogenic. Highly suitable for radio; as, a radiogenic script.

radiosondage. Term adopted by international agreement for the method of obtaining meteorological data in the higher altitudes by sending into the stratosphere a small balloon equipped with instruments and a short wave set for transmitting the data to the ground.

Ration D. An emergency ration in the form of a candy bar containing 600 calories of chocolate, vanilla, sugar, milk and oat flour; developed by the U.S. army.

recap, v. To replace the worn surface of a tire after the

top of the tread and as much of the shoulder as necessary have been filed off. See top cap. Also recap, recapping, n. ringdom. The realm of prizefighting. (-1940)

Roger. Technically, "Your message has been received." Loosely, O.K.

Sansei. A third generation Japanese in the United States. A child of Nisei parents. (-1940)

script, v. To write a script; to adapt a story for radio production. scripteur or scripter, n.

scuttle, v. To wreck, destroy; impair seriously; reject. selectee. One who had been inducted but not sworn into the U.S. army (from Selective Service).

shrapnel. Fragments falling from the explosion of antiaircraft shells.

smoke jumper. A forest fire fighter dropped by parachute.

Spit. (Brit.) Slang. Short for Spitfire fighter plane.

starlet. A young, usually quite promising, motion picture actress.

station-master. (Brit.) One in command of an airfield. stick of bombs. Bombs placed in a bomber so that they can be dropped at predetermined and regular intervals.

stumble-bum, stumblebum. Awkward, clumsy, inept.

Sutton's Warbler. See Dendroica Potomac.

T4. Short for cyclotrimethyltrinitramine, an Italian explosive employed as a primer.

tanker. Mil. Member of a tank crew.

telecaster. One who telecasts, that is, broadcasts by television.

Third Termite. Jocose. One wishing a third term for President Roosevelt.

top cap, top capping. A resurfacing in which only the top of the wornout tread of a tire is smoothed off before the new rubber is applied. See recap.

vackie. (Brit.) Short for evacuee; specif. anyone sent from London early in the war as a precautionary measure.

wedgies, wédges. Shoes with a solid, wedge-shaped platform sole.

whistle-bomb. A bomb to which is attached a mechanism that screams or whistles as the bomb falls.

winterization. Putting in condition for the winter; as, the winterization of an automobile. (-1940)

wonder drug. Generic term for drugs like the sulfa drugs, with remarkable curative powers.

1941

As the United States sped its mobilization of manpower and industry and then finally entered World War II in the last month of 1941, the new words of that year indicated primary interest in things military. Some words were humorous, some deadly serious, and most had the virtue of accurate description.

* * *

Airathon. A series of five tests with point scoring for competing college fliers.

airgraph. (Brit.) A system developed by the British for microfilming letters to conserve space.

airtel. A place similar to a motel (q.v.) for travellers by plane.

alertion. The state of being on the watch for or on guard against danger, as an air attack.

all-outer. One who, impatient of half-measures, tavoured a rapid move towards a complete war economy.

area. Specif. (Brit.) A part of a city or town serving as a unit in the defense program against air raid fires.

637

AT. Initials of anti-tank.

Atlantic Charter. The eight-point charter worked out by Pres. Franklin D. Roosevelt and Prime Minister Winston Churchill at a conference on the Atlantic ocean in 1941.

balding. Becoming bald.

battle station. One's assigned post on shipboard during battle.

beam; fly the iron beam. Aviation slang. Use a railroad as a guide in a plane. fly the wet beam. Aviation slang. Use a river as a guide in a plane. off the beam. Slang. Going in the wrong direction, incorrect; crazy; doing badly. on the beam. Slang. Going in the right direction, correct; sensible; doing well.

black, put up a. R.A.F. Slang. To commit an error; confess to a poor job in executing an assignment.

blackout. A loss of consciousness, usually of short duration, as from making a high-speed turn in an aeroplane.

blitz buggy, wagon. A car for staff purposes.

blitzfighter. (Bnt.) A member of the fighting forces defending England against the German blitz.

bolona. (Bnt.) A night free of bombing; coined by the Germans from "bombenlose nacht," literally bombless night. Also bombenlos.

bomb run. That part of the course of a bomber extending from the time the bombardier assumes control until he releases the bombs over the target.

butcher wagon. Slang. An ambulance. Also meat wagon.

chatterbox. (Brit.) Slang. A machine gun used against aeroplanes.

cliff-hanging. The habit of ending an episode of a radio serial at an exciting and uncertain point (in an earlier day the hero or heroine in motion pictures would frequently be left actually hanging from a cliff). (-1941)

conventioneer. A person who goes to a convention. (1940)

contour-plow, v. To plow according to the contour of the land, to check or prevent erosion. (-1941)

cooling-off period. A period, usually 30 days, to allow violent emotions to subside, as following the declaration of a strike.

covered wagon. Slang. An aircraft carrier.

crash-land, v. To bring a plane down with enough of the landing gear inoperative to run the risk of at least a partial crash.

creative pause. A term used by the nazis to describe a quiet period in the fighting, sometimes after a conquest, when gains were consolidated and preparations for future engagements made.

de Gaullist. A follower of Gen. Charles de Gaulle. deglamourize, v. To strip one of glamour; to make plain. dematerialization. A direct hit that so severely damages a vessel as to make it sink.

de-Quisle, v. To disable an automobile for use by Quislings and the like by stripping it of spark-plugs, carburettor, or other parts necessary to its operation.

desynchronized, adj. Not synchronized, said of twin engines in a German aircraft.

dit da man. U.S. army slang. One working with dots (dits) and dashes (das), namely, a radio operator.

dogface. U.S. army slang. An ordinary soldier.

dream up, v. Make up; imagine, as in a dream; work out in one's own mind.

Dunkirk, n. A loss, repulse, set-back; from the Battle of Dunkirk in June 1940, when the English were forced to

withdraw all their troops from the continent.

fellow-travelling, n. The state of being sympathetic to and co-operative with the Communists. (-1941)

ferrying command. A unit organized May 29, 1941, for the purpose of transporting planes from the United States to Canada for delivery to the British.

fireblitz. A bombing with incendiary (fire) bombs.

fire bomb. An incendiary bomb.

flak. (Ger. Fluegerabwehrkanone, fr. Flueger, aircraft+Abwehr, defense+Kanone, gun.) The fire from anti-aircraft artillery.

flash. A combining form meaning that which happens quickly, often unexpectedly, of short duration, frequently with a suggestion of violence; as, flash fire, flash flood. (-1941)

flying boxcar. A large aeroplane hauling cargo; sometimes applied to a bomber.

four freedoms. The four essential human freedoms described by Pres. Franklin D. Roosevelt in a speech made on Jan. 6, 1941, as freedom of speech and of religion; freedom from want and from fear.

fragmentation bomb. A bomb scattering shell fragments over a wide area.

Free French. The French opposed to collaboration with Germany; the non-Vichyites.

gen.—pukka gen, real gen. R.A.F. slang. That highly restricted information available only to insiders, the low-down; later, supposed "low-down" that is unreliable. (pucka, pukka, of Hindu origin, had long been in use in the sense of real, genuine.)

George. Slang. Name given to a gyro pilot. Also called an iron mike.

gramicidin. One of the so-called germ chemicals obtained from soil germs, especially effective against Grampositive micrococci.

grease monkey. Helper to an aeroplane mechanic.

Hitleristic, adj. Of, relating to, or having the qualities of Adolf Hitler.

hypo-happy. Very enthusiastic about the subject of photography.

iron mike. Slang. See George.

island. The superstructure of an aircraft carrier, located on the starboard side.

jeep. A small, versatile, highly manoeuvrable combat car and truck. The word may have come from the fact that the pronunciation of the letters G. P. (general purpose) on the early jeeps recalled the habitual utterance ("jeep") of the character in E. C. Segar's comic strip, "Popeye."

jook joint. Name of uncertain origin to describe a place of entertainment, such as a roadhouse, serving drinks and equipped with a juke box for dancing. (-1941)

juke box. An automatic record player, so called from its association with a jook joint (q.v.), playing a record when a coin is put in a slot. In some, there was a mechanism for obtaining the record desired; in others, the records played in rotation. (-1941)

lease-lend. See lend-lease.

lend-lease, adj. Of or pertaining to the U.S. Lend-Lease act (March 1941), whereby supplies and services could be lent or leased to Allied powers. Also lend-lease, n. & v. t.; lease-lend, adj. & v. t.

liase, liayshe, v. (Brit.) To form a liaison with.

lid. U.S. army slang. A radio operator.

line, shoot a. R.A.F. slang. To give a blown-up account of one's part in an engagement; to brag.

lovely, n. Slang. An extremely attractive young girl,

con

esp. a model or a screen actress. (Extension of older Brit. usage.)

Loyal Opposition. Opposition to a political party in power which does not go so far as to oppose "fundamental national principles." Used to describe the followers of Wendell Willkie.

mastermind, v. To exercise or display superior mental qualities.

meat wagon. Slang. See butcher wagon.

motel. A motorists' hotel, a group of individual cottages, equipped with modern conveniences, for the accommodation of motorists. See airtel.

Naziphile, n. An enthusiastic adherent of nazi beliefs and policies.

Nip, n. & adj. Short for Nippon, Nipponese; a Japanese. occupation money. Unsecured money printed by the Germans in occupied territories in such quantities as were necessary.

oil bomb. An oil-filled sphere in whose centre are high explosives which ignite the oil and scatter it in all directions.

old-school-tie. Pertaining to British public school graduates, esp., often derisively, to their group loyalty and their proneness to follow what is well established.

organise. (Brit.) An adaptation of the German organisieren, "to get hold of, obtain, illegally."

peep. U.S. army slang. Term used for a bantam car, esp. in contradistinction with the larger jeep.

penicillin. A powerful, nontoxic substance (a so-called germ chemical), obtained from a mold, which acts on various kinds of infection, including that resulting from streptococci, gonococci, meningococci and pneumococci.

Pentolite. A very high-powered explosive.

playsuit. A summer sports outfit, usually consisting of shirt, shorts and detachable skirt.

plushy, Fig. Smugly opulent; wealthy, luxurious.

prang. R.A.F. slang. To crash in a plane; to damage or smash up an aeroplane.

pump-primer. Temporary remedial action by the government designed to get the economic machine started. (-1941)

radiolocator. An instrument developed by the British to detect and locate objects, especially military, by means of radio waves.

RDX. An explosive developed by the British said to be 40% more powerful than TNT.

rheotron. A device which gives high speed (energy) to beta particles (electrons) by whirling them around in circular orbits.

Rh factor. An agglutinable factor designated as Rh because it is elicited by the sera of guinea pigs immunized with the corpuscles of rhesus monkeys; the factor was discovered by Karl Landsteiner and Alexander S. Wiener, in 1940, to be present in the erythrocytes of about 85% of human beings.

riser, n. & adj. One of the supports extending from a parachute to the parachutist.

scatter gun. \tilde{U} .S. army. A machine gun employed against aircraft (in older usage, a shotgun).

sea marker. An aluminum powder which dyes the sea and makes it possible to reckon the drift of a plane; used also as a distress signal.

shooting war. A war of battles rather than a war of nerves, or propaganda, or sanctions.

silk, hit the. U.S. army slang. To descend in a parachute.

ski troops. Troops operating on skis. ski trooper. smooching. Slang. Caressing, petting, necking. (-1941)

soften, v. To undermine a country by flooding it with defeatist propaganda so that it might become an easy victim to actual military invasion.

strategic bombing. Long range bombing designed to bring about the collapse of an enemy country by bombing out industrial plants, means of communication and other parts of its vital economic organization.

strep throat. A throat with a streptococcus infection.

Stuka (Ger. "Sturz," crash+"Kampf," fight.) A German dive bomber.

sugar report. Slang. A letter from one's girl or sweetheart.

swing shift. The 4 P.M. to midnight shift in industrial plants, corresponding to the second trick of railroad telegraph operators.

tactical bombing. Bombing designed to aid the ground forces in a military manoeuvre.

tin can. Slang. A destroyer.

umbrella. A number of aircraft, usually fighters, which protect land or sea forces by operating over and around them, forming a kind of umbrella.

V-for-Victory. Slogan adopted by several Allied nations in the propaganda war against the nazis.

water wasp. The PT-10 torpedo boat, equipped with three motors, each capable of developing 1350 h.p.

withholding tax. An income tax collected at the source, that is, withheld from a payment of salary, wages and the like.

wolf pack. A small fleet (usually three or more) of submarines organized to attack enemy shipping, especially convoys.

yard bird. U.S. army slang. A new recruit. zippered. Supplied with a zipper, or slide fastener.

1942

As during the three preceding years and the three succeeding years, the new words and meanings of 1942 dealt mostly with the conflict which had now spread to the most remote corners of the world.

* * *

ABDA. The Southwest Pacific area; from American, British, Dutch, Australian, the countries waging war in that area against Japan.

adtevac. A word composed from adsorption, temperature and vacuum to describe a process whereby blood can be dried on a large scale to make blood plasma.

Alcan Highway. The Alaska-Canada highway, an interior direct road from Fairbanks, Alaska, to Edmonton, Alberta, running between parallels 62° and 63° north and paralleling Canada's chain of airports, officially opened Nov. 20, 1942.

antipersonnel mine. A mine employing a hair-trigger trip-type of mechanism, which rises several feet above the ground before it explodes, scattering shrapnel over a large area.

AP. A drug, derived from coumarin, with anti-blood-clotting properties that make it useful in the treatment of thrombosis of the legs.

assault boat. A 200 lb., powered, plywood boat carrying up to 11 men, which lends itself especially to scouting and actual assault work.

Atabrine. A drug (quinacrine hydrochloride), produced in tablet form, very effective in the treatment of malaria. Trade mark.

AVG. The American Volunteer group, a group of Amer-

ican aviators fighting in China under Brig. Gen. Claire Lee Chenault.

backstage, adj. Behind the scene, hidden, not readily apparent.

betatron. A machine which gives high speed to beta particles by whirling them around in circular orbits. (The 1941 term rheotron was largely supplanted by betatron.)

blacketeer. One who buys or sells on the black market.

ported from Burma to China; hence, fig., a similar road or route for the transportation of supplies and materials; as, "An Alaska-Siberia Burma Road."

call. Available for prostitution, especially for engagement by telephone. (-1942)

car pool. A voluntary pooling of private vehicles, esp. for commuting.

Chemigum. A strong, tough, resistant synthetic rubber developed by the Goodyear Tire and Rubber company, used in the manufacture of such products as tires, hose and gasoline tanks. Trade mark.

CINCPAC. The Commander-in-Chief of the Pacific fleet.

clipper, v. t. & i. To travel, or be sent by, clipper plane. commandoman. A member of a commando unit.

COMINCH. Commander-in-Chief of the U.S. fleet. (This term supplanted Cincus because the pronunciation of the latter suggested sink us.)

cook with gas. Slang. Make headway, go in the right direction. (-1942)

crash-landing, n. The landing of a plane when its landing gear is ineffective.

C ration. A ration for soldiers consisting of a day's supply of precooked food, including meat, vegetables, crackers, sugar, hard candy and coffee, for use in the field.

cuff, off the. Slang. In an informal or unstudied manner; unrehearsed.

Demerol. A synthetic analgesic, almost as potent as morphia but lacking its strong tendency to addiction, which takes effect within 15 to 20 min. and lasts several hours.

dicoumarin. A synthetic chemical (found naturally in spoiled sweet clover) which, taken through the mouth or hypodermically, reduces the tendency of the blood to form

dim-out, n. & v. A decrease in the amount and extent of illumination.

door-key children. "Defense work orphans" who, lacking supervision because both parents were at work, went about carrying their house keys.

E. A joint award, symbolized by a pennant bearing an "E," made by the U.S. army and navy to those industries doing an excellent job of production in the war effort.

eagle day. U.S. army slang. Pay day. (From "eagle," a ten dollar goldpiece.)

expendable, adj. Of or pertaining to that which can be used up (expended) without regard to cost; said of materials or men to be sacrificed, or already sacrificed, in the attainment of a military objective. (-1941)

Festung Europa. See Fortress Europe.

Fighting French. Term supplanting Free French, the anti-Vichy group.

finger park. A residential area consisting of a landscaped central park from which extend like fingers deadend driveways for the surrounding dwellings.

flame cultivation. A method of burning off weeds without harming the crop.

flash freezing. A method of quick-freezing of foods developed at the University of Texas. The quick-freezing of the surface juices prevents the juices and the flavour from

flat-top. An aircraft carrier, so called from its large, flat landing surface for planes.

Foamglass. A black glass, with low specific gravity, which has the properties of buoyancy and insulation. It was developed by the Pittsburgh Corning corp.

Fortress Europe. (Ger. Festung Europa.) An idea begun Burma road. The road over which supplies were trans- . by the Italian press of considering Europe as an impregnable fortress so that the Allies, discouraged, might sue for peace.

frozen food. A food frozen so rapidly that its chemical composition, and hence its taste and food value, is unaffected.

gas hog. Slang. One using more than his share of rationed gasoline.

Geronimo. The name of an old Indian warrior shouted by paratroopers jumping out of a plane.

grasshopper. Slang. A small, low-speed, highly manoeuvrable cabin monoplane (such as the Piper Cub), supplied with a two-way radio, used for military observation.

greenhouse. Air slang. (1) The Plexiglas-like cover enclosing the cockpit, cabin, and other parts of a plane where visibility is desired. (2) The place so covered.

gremlin. A spiteful little creature thought by airmen to be responsible for all sorts of trouble involving aircraft.

Gyrene. Slang. The co-pilot of a glider transporting soldiers or freight.

heavy. Short for heavy tank, such as the 60-ton supertank of U.S. build. (1941)

Herrenvolk. (Ger.) Term used by the nazis in the sense of "master race" to describe what they regarded as their own position in world society.

horizontal bombing. Bombing at low altitudes (1,500 to 2,000 feet) from fighter planes which, once the two bombs with which they were equipped were away, could be manoeuvred quickly to a safe altitude to escape the effects of the exploding bombs.

igloo. A place for storing ammunition.

immersion foot. A potentially gangrenous condition similar to frostbite which comes about when the foot is immersed in sea water too long without adequate exercise.

inductee. One inducted into the U.S. armed forces. (-1942)

Japanazi, adj. Of or relating to the Japanese and the nazis as copartners in World War II.

jerk, n. Term of disparagement for anyone, especially if stupid, regarded unfavourably.

Kenny method. A technique of treating polio developed by the Australian nurse Elizabeth Kenny, in which the paralyzed part is kept free and gently exercised.

K. P. pusher. U.S. army slang. One who supervises, especially the kitchen police.

K ration. (Army ration K.) An emergency ration for soldiers consisting of two pounds (in three packages, the equivalent of three balanced meals) of concentrated bread, meat, drink and dessert. Earlier, "parachute ration."

Niacin. Name recommended by the National Research council and approved by Federal Security Administrator Paul McNutt for "nicotinic acid," the anti-pellagra enriching element used in flour, to allay the fears of those who might believe nicotinic acid to be the poisonous acid derived from tobacco. For the same reason, nicotinic acid amide was to be called Niacin Amide.

Niacin Amide. See Niacin.

one-stop, adj. Pertaining to those filling stations, stores

6/11

and the like where a shopper, especially a motorist, can supply all his wants in a particular line.

PAB. Short for para-aminobenzoic acid. (-1942) paleogrostology. The study of fossilized grasses.

para-ski, adj. Pertaining to paratroops manoeuvring on skis.

pattern blackout. A partial blackout by means of destroying light patterns that aid aeroplane pilots in getting their bearings.

PC boat. Literally, a patrol craft boat, varying in length from 110 to 170 ft., supplied with a diesel engine, and equipped to locate and fight submarines. (-1942)

P.F.C. Private first class.

point rationing. A system of rationing of scarce articles, which could be purchased only in exchange for coupons, limited in quantity and good only for a certain period, each with a specific point value.

prefab, n. Shortening of prefabricated unit, as a house, consisting of standardized parts which can be put together at the final location.

preference rating. A rating given commodities according to the importance of the use to which they are to be put; as, steel to be used in the construction of warships would have a higher preference rating than that to be used in civilian building.

Promin. A drug, related to the sulfas, of some promise in the treatment of tuberculosis.

Quonset hut. A 56 by 20 foot insulated presab produced in Quonset, R.I. (whence its name), with a semicircular metal roof, and equipped with a plywood floor and electric lighting, widely used by the U.S. army and navy for housing and hospitalization.

radar. Word derived from Radio Detection and Ranging, to describe the technique of finding and locating objects by sending out radio waves which are reflected from the objects in the manner of an echo.

reception centre. The centre where the U.S. inductee was given his second physical examination and numerous other tests, and where he received his civilian and military occupational classification. (-1942)

rejectee. A U.S. inductee rejected because of some disability. (-1942)

rev it up. Slang. To go more rapidly; speed up.

roll-back, rollback. A government-ordered reduction to former (and usually lower) levels of those commodity prices not subject to OPA regulations.

ropey, adj. R.A.F. slang. Disagreeable, unpleasant, unpopular (person).

sack, adj. U.S. army slang. Pertaining to sleeping, as in "hit the sack" (go to bed).

Saran. Trade mark of a synthetic material, which, made into cloth, has many useful properties, including resistance to water.

scrambled eggs. U.S. naval slang. Nickname for the intricate gold braid on the caps of high-ranking naval officers.

screen. An interview, test, or the like for the purpose of eliminating the psychologically unfit from military service.

Sixth Column. A coinage of Col. Richard C. Patterson, Jr., to describe those who gossiped and spread rumours inimical to the U.S. war effort.

skyglow. Reflection of city lights against a night sky. slit trench. A V-shaped trench somewhat like a foxhole. spending tax. A tax on expenditures for the purpose of promoting war savings.

staging area, base. A military depot; also a place where men are trained for an operation. stinger turret. U.S. army slang. The gun-turret in the tail of a bomber.

Strato-chamber. A chamber made by the York Manufacturing company in which stratospheric conditions could be maintained.

tank destroyer. A motorized vehicle running on rubber tires, equipped with heavy guns to combat enemy tanks but without heavy armour for greater manoeuvrability.

task force. A group of military, naval and air units brought together under a single commander in any combination necessary to accomplish a specific assignment.

totaquin. A drug obtained from cinchona bark, which can be used instead of quinine in the treatment of malaria. It is not as effective as quinine.

V-day. The designation of the day when the Allies would be victorious over the axis.

victory garden. A small individual wartime garden. victory girl. A girl who, supposedly fired by patriotism, solicited men in uniform.

V-mail. The American system, modelled on the British airgraph, for microfilming letters, sending them overseas in reduced size in a roll and enlarging them for the addressees at some distribution centre.

war time. Official name give by President Roosevelt to year-round daylight saving, adopted Feb. 9, 1942, for the war period. Abbrev. EWT, CWT, etc. for eastern war time, central war time, etc.

zack. Australian slang. A sixpence piece.

zip. To close or fasten by means of or in the manner of a zipper, or slide fastener. (I. W. R.)

1943

The words of 1943 showed, among other things, the great importance that aeronautics was assuming. Not only was war being waged largely in the air with block-busters, glide-bombs and pathfinders, but the new word aeropolitics indicated that politics and economics were strongly affected by the increased mobility afforded by aviation. The new importance of foods and the danger in their scarcity were reflected in enrich, restore, extend and stretch.

activate. To bring into active existence, as "to activate an air corps squadron"; to put into practice, get busy on, as "to activate a reconversion program." (Orig. military, -1941.)

aeropolitics. Political and economic development as influencing, and as influenced by, the development and application of aviation. (Burnet Hershey, Feb. 28, 1943.)

bazooka. A firearm, consisting of a metal tube slightly over 50 in. long and under 3 in. in diameter, with a shoulder stock, front and rear grips, sights, electric battery to set off the charge, and trigger, designed to launch rocket projectiles. It is operated by two men, one holding and firing the gun, the other loading. (Major Zeb Hastings, 1942, after the musical instrument invented by Bob Burns, 1905.)

block-buster. The 4,000-lb. bomb dropped by British Lancaster planes beginning in March 1942; a similar heavy bomb. (1942)

brief. To give formal instructions, regarding a scheduled military operation, to those about to engage in it. (-1940) brownout. A voluntary, partial dimout. (Australia, 1942;

U.S., 1943.)

cargoliner. A transport plane carrying freight exclusively. (1943)

chin turret. A gun turret mounted beneath the nose of bombers. (1943)

co-belligerent, adj. Fighting together (with another power) without a formal alliance, as "co-belligerent Italy." n. A country so fighting. (-1813)

commando. A unit of British soldiers trained in closerange fighting for raids on axis territory; loosely, a member of such a unit, or of a similar unit of another nationality. (Winston Churchill, Oct. 10, 1941, from Portuguese or Spanish comando adopted as name for defense units of Boer Republic.) Compare ranger.

enrich. To supply with added food value, esp. with vitamins and minerals. Government standards were promulgated in May 1941 and on July 3, 1943 for enriched flour. (Frank L. Gunderson, summer 1940, from Quaker Oats Co., 1932.) enrichment.

expediter, expeditor. An official charged with keeping uninterrupted the flow of materials or of routine work in industry and government. Some expediters were agents of the U.S. army and navy; others were in direct employ within industries and government bureaus such as the War Production board. (General Electric Co., c. 1925.)

extend. To make a scarce or expensive food go farther by preparing in combination with a cheaper or more plentiful food, as "to extend meat with cereal." (-1934 as "to adulterate.") extender.

featherbedding. The limiting of work or output in order to spread jobs and thus prevent unemployment. featherbed rules. Union regulations to accomplish featherbedding.

feather merchant. A slacker. (After comic-strip characters of Billy De Beck, 1937, from earlier senses.)

G.I., G.I. Joe, n. An American soldier. G.I. was to the army as a whole what doughboy was to the infantry. (Short for G.I. soldier, -1941) adj. Pertaining to the army services, or ministering to its needs, as "G.I. food," "a G.I. dance." (Government issue.)

glide-bomb. To bomb, from an aeroplane, by descending at an angle of less than 65° from the horizontal when releasing bombs. Steeper dives are called *dive-bombing*. (-1940)

globaloney. Nonsense about matters affecting the world as a whole. (Global baloney. Rep. Clare Luce, Feb. 9, 1943.)

handie-talkie, military. A portable two-way radio telephone weighing about five lb. (-1942) Compare walkie-talkie.

homeostasis. The tendency of living organisms to maintain a relatively stable condition by means of mechanisms which compensate for disturbing factors. (Walter B. Cannon, 1926.) A similar function elsewhere, as in the social organism. (-1941)

incentive pay. Wages paid in accordance with various "incentive plans" or "systems" which reward increased production; in particular, a piece-work or modified piece-work system. (-1907)

longram, telegraphy. A deferred day message with a minimum charge for 100 words. (Long telegram. Dec. 1942; service effective Feb. 1, 1943.)

mission. The objective of an operational flight, esp. where bombing is involved; the flight itself. (-1942)

mock-up. A model of an aircraft, constructed of inexpensive material and usually full-size, for the purpose of prearranging or studying details of construction and use. (-1938) A similar model of other items of military equipment. (-1942) A model in general. (1943)

newsmap. A map issued periodically with current events depicted on it, and with accompanying text and illustra-

tions. (News Map of the Week, a copyrighted periodical,

pathfinder. A flare capable of illuminating the ground for bombing purposes, even through fog, when dropped by attacking planes. Called also *TI* (target-indicator). (Nov. 1048.)

pattern-bomb. To bomb, from a number of aircraft, in such a way that the relative position of the craft determines the "pattern" of the bombs when they strike, so as to cover the target in a desired manner.

pesticide. An agent for controlling farm or garden pests of whatever sort. The Canadian Fertilizers and Pesticides administrator was commissioned Jan. 20, 1942. (Grant S. Peart, Sept. 18, 1940.)

pin-up girl. A girl with whose picture men, esp. soldiers, liked to decorate their quarters. (-1941)

probable. A supposed casualty, esp. referring to military craft, as "there were ten destroyed and five probables."

ranger. A member of a battalion of U.S. soldiers, formed Dec. 1941, trained in close-range fighting for raids on enemy territory. (1942) Compare commando.

restore. To bring back a food to the original nutritive value of its ingredients. (1939)

scuttlebutt, naval slang. Gossip; a rumour. (-1938. Scuttle-butt story, -1901; scuttle butt, drinking fountain on board ship, -1843.)

Seabees (gen. plural). The U.S. navy construction battalions, comprising welders, carpenters, mechanics and other personnel skilled in building and supplementary trades, trained to fight as well as work in the field. (1942)

shuttle, combining form. Involving vehicles, esp. aircraft, making repeated trips between fixed points, as "shuttle bombing," "shuttle raid," "shuttle plane." v. To move a vehicle or by a vehicle in such trips. (-1941, from shuttle train, -1891.)

snafu, military slang. In a mess, haywire. (Situation normal; all fouled up.)

sortie. An operational flight by one military aircraft. Each return to base for replenishment was counted as the end of one sortie.

stretch, stretcher. See extend.

suntans. Summer uniform worn by U.S. soldiers.

TI. See pathfinder.

trainasium. A conglomerate structure of metal bars, resembling a large bird-cage, used to develop muscular coordination in military training. (Training gymnasium. –1942.)

triphibian. Adapted to or using the three elements, land, water and air, as "a triphibian assault." (Tri+amphibian. Winston Churchill, Aug. 31, 1943.)

triphibious. See triphibian. (Tri+amphibious. Leslie Hore-Belisha, 1941.)

underground, n. An outlawed political or military movement or organization operating in secret; such organizations collectively, as "the European underground struck against naziism"; underground fortifications, materials or equipment protected under ground against attack. adv. Into hiding, into the underground, as "the patriots had to go underground." undergrounder. A member of the underground.

upgrade. To raise (the name or number of a quality) without improving the quality itself, as "cheaper meats were illegally upgraded." (-1941)

walkie-talkie, walkee-talkee, walky-talky, military. A two-way radio telephone small enough to be transported on horseback; a smaller set carried on the back of one man. (-1940) Compare handie-talkie.

wolf. A determined would-be seducer, a man "on the

The terror aroused by the buzz-bomb accounted for the many names coined for the jet-propelled weapons which entered into European warfare in 1944, among them flybomb, robomb and Vengeance weapons 1, 2 and 3.

In the U.S., delinquency among teen-agers and the bobby sox brigade assumed alarming proportions because of homes disrupted by the absence of parents in the armed services or war production. There was, however, a new note of confidence in V-E day, V-J day and X-day.

aerosol bomb. Bomb used in spraying insects. It contains pyrethrum extract, oil of sesame and freon. (1943)

airpark. A small airfield, in or close to a community and financed by it, for private fliers. (1944)

airstrip (also strip). A strip of land, frequently in a newly conquered area, hurriedly levelled off for use by aeroplanes. (-1942)

amtrac. An amphibious tractor. (1944)

bobby socks (sox) brigade. Teen-age girls, chiefly the high-school group, who engaged in such activities as listening for hours on end to recordings, and making long phone calls with boys with whom they were friends.

buzz, v. t. & i. To fly dangerously low, esp. in congested areas, frequently to show off. (-1941)

buzz-bomb. A jet-propelled bomb, designed like an aeroplane and launched like a rocket from specially built ramps. Its speed was around 300 m.p.h. and its maximum range about 150 mi. The main body contained a ton or more of explosive, which was set off by the fall of the plane when its fuel burned out. First used by the Germans in June 1944. (1944)

cannibalize. To salvage the sound parts of damaged equipment for re-use. (-1943; older in the services.)

collaborationist, specific. One who collaborated with an axis country, esp. Germany. (-1941)

combat fatigue (also battle, operational, war fatigue). Euphemism for a neurosis resulting from combat conditions. (1944)

cut back, v. To decrease the volume of an order in accordance with procedure provided for in the contract. Also cutback, n. (1943)

D-day. The day set for a military operation; used so that the actual day could be kept secret. (-1942) Specific. The day of a certain operation, as June 6, 1944, the invasion of western Europe. (Mil. 1918.)

DDT. Initials of a powerful insecticide, dichloro-diphenyl-trichloroethane. (-1943)

deepfreeze. Trade name of a food locker made by Motor Products corporation for maintaining temperatures around o°. (-1942)

dim view. Unfavourable opinion of. (-1941)

ditch. Land a disabled plane on water. (-1943)

doodle (bug). The buzz-bomb, so named possibly to make light of it. (1944)

double summer time. (British.) Two hours ahead of Greenwich mean time. (1944)

dropping zone (also drop zone, dropping ground). Area where paratroops land. (1943)

duck. A two-and-a-half-ton amphibian truck made by General Motors. (-1943)

E.A.M. (Ethnikon Apelether ikon Metopon.) In Greece, the National Liberation front.

earthquake bomb. A six-ton bomb which penetrates the ground, where its delayed-action fuse causes an earthquaking explosion. (1944)

E.D.E.S. (Ellinikos Dimokratikos Ethnikos Stratos.) In Greece, the Hellenic National Democratic army, a conservative group. (1944)

E.L.A.S. (pron. ā'las; Ellinikos Laikos Apeletherotikos Stratos.) Hellenic Peoples' Army of Liberation, the military arm of E.A.M. (1944)

exploded sketch, view. A picture that shows the parts of a piece of machinery slightly spread apart (exploded) so that their relation to each other is clear. (1944)

factory buster. A six-ton bomb. (1944)

F.F.I. French Forces of the Interior, organized to combat the Germans in France. (1944)

flying bomb, also flybomb. A buzz-bomb. (1944)

flying jeep. Army nickname of the Vultee Sentinel, a small aeroplane also known as a grasshopper. (1943)

geeheebee (also Jahemy, Jeramy). Movable dry-dock.

gobbledygook. Word coined by Maury Maverick to describe the involved and abstract language of Washington official documents. (1944)

hump. A 525-mi. skyway from Assam, India, to the Yunnanése plateau, over which the American transport command flew supplies to China. The "big hump," where the Himalayas reach nearly 20,000 ft., is the watershed between the Salween and the Mékong rivers. Fliers who cracked under the strain of flying the hump were said to be "hump happy." (1943)

jeep, v. t. & i. To ride some one in a jeep; to ride in a jeep. (-1942)

jet plane. Plane operated by jet-propulsion. Sometimes shortened to jet. (1944)

jet propulsion. Principle of locomotion in which air is sucked into an engine, partially heated, and compressed, Mixed with a combustion fuel, the expanded air becomes the jet whose backward push gives a forward motion. (-1932)

L.C. (Elsie). Landing craft. Other craft, all designated by their initial letters, were landing craft control, landing craft infantry, landing craft mechanized, landing craft personnel, landing craft rubber, landing craft support, landing craft tank, landing craft vehicle, landing craft vehicle personnel. (L) or (S) following the initials denoted large or small, for example: L.C.I.(L). (1943, 1944)

locust tank. Glider-borne seven-ton tank. (1944)

L.S.D. Landing ship dock. A floating dock 450 ft. long, used following an attack. (1944)

L.S.M. Landing ship medium. (1944)

L.S.T. Landing ship tank. For transporting tanks. Large doors in the bow and a ramp permitted rapid unloading. (1943)

maquis, mackey, maquisard (Fr. maquis. In Corsica, land covered with brush and small trees whose branches spread out from their bases. [Larousse.]) Guerrilla-fighter members of the French underground who, because wanted by the German police, operated in the hills and the woods. (1944)

milk run. Regular bombing of a target. (-1943)

N.P. Neuropsychosis, neuropsychiatric. (-1944)

obliteration bombing. Concentrated bombing tending to wipe out. (1943)

P.A.C. Political Action committee of the C.I.O., organized to support the interest of labour within the existing two-party system. (-1944)

p.o.w., **p.w.** Prisoner of war. (-1944)

reconversion. Specific. The change from wartime economy to the peacetime economy following the end of World War II; as, the changing of a factory converted to the production of war materials back to its peacetime manufacturing. (1943)

renegotiation. Specific. The renegotiation by the government of original contracts to bring them more in line with actual costs as revealed by experience. (1943)

reslooming. Trade name of a process developed by the Monsanto Chemical company, whereby textile fibres and fabrics may be treated with a water-soluble melamine type of compound so as to impregnate the resin into the fibres. This process imparted greater resilience to cotton and rayon fabrics and reduced the shrinking and felting of woollens and worsteds. (1944)

robomb (robot bomb). A buzz-bomb. (1944)

robot, robot bomb, robot plane. A buzz-bomb. (1944) sad sack. A well-intentioned but downtrodden U.S. soldier who never seemed to do anything right; character in comic strip by George Baker. (-1943)

saturation bombing. Concentrated bombing. (1943)

S.H.A.E.F. (pron. shāf). Supreme Headquarters Allied Expeditionary force. (1944)

sky train. A train of gliders towed by a plane. (1944)

sky-troops. Airborne troops. (1944)

spot authorization. A procedure whereby local WPB agencies would give manufacturers permission to make civilian goods if they could show they had labour and machinery which was not needed for the production of war goods. (1944)

sweat it out. To await, usually with sickening apprehension and worry. (-1941: may go back to Mark Twain.)

Sytons. Trade name of a group of silica compounds developed by the Monsanto Chemical company. Fibres and fabrics given a treatment of a dilute Syton solution show less tendency to slip or fray because of the deposit of submicroscopic particles. Stockings so treated are less likely to run. (1944)

take-home pay, take-away pay. Amount left after various deductions, such as for bonds and withholding tax, have been made from wages. (1944)

tank-dozer. A medium tank equipped with a scraping blade similar to that of the bulldozer. (1944)

teen-ager. One in his teens. (1943)

teen can, teen canteen, teen town. Recreation centre for teen-agers. (1944)

triptane. A fuel (paraffinic-trimethylbutane) with nearly four times the horsepower of 100-octane gasoline. (1943)

V-1 (Ger. Vergeltungswaffe, eins: vengeance weapon, one). A buzz-bomb. (1944)

V-2. Vengeance weapon, two. A long rocket projectile, weighing 12 tons at the time of launching, with a bomb load of from one ton up, which, shot some 68 mi. into the super stratosphere, fell and hit the ground at 800 to 1,000 m.p.h., so fast that people were struck before they heard it. Sometimes called a telephone pole bomb. (1944)

V-3. Vengeance weapon, three. Said to be a projectile about 60 ft. long, 51/2 ft. in diameter, and 14 tons in weight at the time of shooting. Launched straight up, it is then directed by radio. (1944)

V-bomb. Generic term for V-1, V-2, V-3, etc. (1944)

V-E day, V-J day. Victory day in Europe, Japan, respectively. (1944)

X-day. The day of peace following World War II. (1944)

The Atomic age was separated from the pre-atomic era by the event of Aug. 6, 1945, the horror of its destructiveness lightened, however, by the peacetime promises of atomic energy. The United Nations showed that new world organizations were ready to cope with world problems. Separatee, liberee, returnee and de-vacuee were new terms, happier in tone than their wartime antonyms.

A-bomb. See atomic bomb.

abort. To fail to complete a mission or flight; said of an aeroplane. (1944)

ABSD. (Advance Base Sectional Dock.) A prelabricated dock where battleships could be repaired.

ABSIE. From the initials of the American Broadcasting Station in Europe, which operated from April 30, 1944, to July 4, 1945. (1944)

Admiral of the Fleet. (U.S.) A five-star admiral. (1944;

older in British usage.)

airbrasive method. Drilling of teeth by an abrasive subjected to high pressure and pinpointed on the area to be drilled.

airedale. One who handles a plane on an aircraft carrier; a "plane-pusher."

air-sea rescue. Recovery of air crew after they had bailed out over water. Rescue was effected by a patrol plane which radioed the position of the survivors to a station. The station, in turn, sent out a rescue boat. (1944)

Alsib. Air route from Montana to Moscow so named because it passed over Alaska and Siberia.

Amvets. The American Veterans of World War II. (1944)

Anti-G suit. See G-suit.

ANTU. A poison, harmless to human beings, so powerful that 1/3 lb. will destroy 100,000 rats.

Ascender. An experimental fighter aeroplane (XP-55) with the propeller in the rear. Made by Curtiss-Wright Corp.

atobomb, atom bomb. See Atomic bomb.

atom bombing. See atomic bomb.

Atomic age. The new age dominated by atomic energy, ushered in with the dropping of the first atomic bomb, Aug. 6, 1945.

atomic bomb. A bomb releasing atomic energy with explosive force estimated to exceed that produced by 20,000 tons of T.N.T. The first such bomb to be publicly used was dropped on Hiroshima, Japan, Aug. 6, 1945. Variants include a-bomb, atobomb, atom bomb, the last the verb form. The bomb was at least once described as a worldbuster. Atom-bombing, n.

atomize. To pulverize; destroy completely.

atomobile. Future automobile driven by atomic energy. Azon bomb. Bomb regulated by radio waves which can be guided by the bombardier of plane. Developed by U.S. air forces.

baka bomb. (Jap. foolish.) Rocket plane driven by a Japanese suicide pilot.

bamboo telegraph, bamboo wireless. Native grapevine. banzai. Desperate, fanatical, suicidal; usually applied to a frenzied attack of Japanese soldiers accompanied by shouts (banzai) and indifference to cost in life. (-1943)

B.A.R. Browning automatic rifle. (-1943) barman. One who operates such a rifle.

belly tank. Auxiliary gasoline tank under the belly or wing of a plane. It can be released if necessary to lighten the load. (-1945)

CAE

blow job. Aviation slang. A jet-propelled plane.

BMB. (Broadcast Measurement Bureau.) An organization composed of advertisers, advertising agencies and radio stations to discover a reliable index of broadcasting effectiveness.

bobby soxer. A teen-aged girl addicted to adolescent fads and crazes. (See 1944 list.)

bogey, bogie. Aeroplane whose identity is unknown. (1944)

bomber's moon. Moon favourable for bombing. (-1943) bug bomb. A spray employing aerosol. (1944)

butcherette. Female butcher.

butterfly bomb. A small anti-personnel bomb dropped from a plane. (1944)

carpet bombing, carpet raid. A bombing attack which attempts to clear the way for advancing ground troops. Such attacks lay bomb carpets.

chosen instrument. A government-authorized air line to represent a country in the international skyways. (-1945) cloak and dagger. Office of Strategic Services; pertaining to OSS.

Conestoga. A large cargo plane made by Edward G. Budd Mfg. Co. (1944)

De Gink Hotel. Name given to the hotels built along the the air transport command routes. (-1944)

dehumidification. Method developed by the United States navy bureau of ships for keeping materials from rusting. (1944)

de-nazification. Eradication of nazi influence. de-nazify, v. (1944)

de-requisition. Release from government occupation.

de-vacuee. (British.) A returned evacuee.

disintegrator. Secret weapon to oppose Kamikaze attacks.

displaced person (DP). Person brought into Germany from conquered countries, usually for purposes of slave labour. (1944)

doggy. Slang. Infantryman.

downgrading. Classifying of a job to a lower grade with less pay. (1944)

DP. Displaced person.

dumbo. Plane used in air-sea rescue (q.v.). (1944)

Electric Blanket. Blanket made by General Electric Co. electrically heated and automatically controlled.

Electronic Rat Trap. A trap made by Electronic Traps, Inc. After being entrapped, the rat electrocutes itself, following which a mechanism ejects the rat and resets itself for the next victim.

EMIC. Emergency Maternity and Infant Care Program. (1944)

Ercoupe. Trade name of a small passenger plane manufactured by Engineering and Research Corp. for civilian use. (1944)

fibrin film. A material made from blood plasma, promising to be effective in averting the convulsions following head wounds. (1944)

FIDO. From the initial letters of Fog Investigating Dispersal Operation, used by the British to disperse fog long enough for planes to land safely.

fighter bomber. A fighter plane equipped to carry a bomb, after the dropping of which the plane can operate as a fighter. (1942)

flash gear. Outfit to protect the wearer from the flames thrown by the explosion of shells and bombs. (-1945)

Fleet Admiral. Admiral of the fleet.

flight test. To test a plane in flight.

flying boxcar bomb. U.S. name for the 700-lb., 5-ft. long spigot mortar of the Japanese.

foo-fighter. Strange fire ball of undetermined origin (possibly controlled by radio) which followed Allied planes early in 1945.

formation stick. An electronically operated control stick which makes manipulation of a plane much easier and thus decreases fatigue to pilots. A joint development of the air technical service command and the Minneapolis-Honeywell Regulator Co.

Fortisan. A very strong yarn made by Celanese Corporation of America, especially for use in flare parachutes. Trade mark. (-1944)

foxhole circuit. A circuit comprising theatres at the various fighting fronts at which U.S. troupes entertained U.S. fighting forces. (1944)

Foxhole university. The United States Armed Forces institute.

fraternize. To deal socially with members of an enemy nation, especially with women; and, specifically, sexually, fraternization, n.

fringe wage. Term used by the War Labor board to describe wages the raising of which did not appreciably increase the cost of production and would not, therefore, challenge the Little Steel formula.

Gammexane. An insecticide (named from its being the gamma isomer of hexachlorene benzene) more powerful than DDT. Its discovery was made by scientists of the Imperial Chemical Industries.

General of the Army. (U.S.) A five-star general, one rank above a full general. (1944)

genocide (Gr. genos, race+cide, killing). A coinage of Professor Raphael Lemkin, of Duke university, Durham, N.C., to describe "the extermination of racial and national groups."

G.I. Jill. A WAC. (-1944)

Globester. Name of plane used by army air transport command in test flights looking toward passenger service extending around the world.

Goop Bomb. The M-76 incendiary bomb. (1944)

G-Suit (G for gravity). A suit designed by the armed services to prevent an airman from blacking out when making quick turns or precipitous dives.

homing pigeon. Button to identify discharged servicemen.

hubba, hubba. Exclamation of enthusiastic approval. (From earlier haba, haba, -1940)

Image Orthicon. A camera tube made by Radio Corporation of America for use in television. It is so sensitive that it can take pictures by moonlight, by the light of a match.

inspectoscope. An X-ray device used by the armed forces to discover illegal objects in packages sent home by servicemen.

island-hopping. Going from one island to another; especially military advance by seizing one island after another as a base, often by-passing one or more Japanese-occupied islands. Used in the Pacific area. (1944)

Jato. From the initial letters of "jet-assisted take-off." (1944)

jet. Combining form for jet-propelled or relating to jet-propulsion, as jet-booster, jet car, jet crew, jet engine. (1944)

jungle rot. Slang. Any of several tropical skin diseases; also, general demoralization.

Kamikaze (Jap. divine wind). (Pron. Kámakazē). A suicide attack by a Japanese plane. Sometimes applied to the plane and also to the pilot.

Kriegie (Gcr. Kriegsgefangene). Prisoner of war. (1944) Lanaset. Trade-mark of a resin put out by the American Cyanamid Co. to make material shrink-resistant.

liberee. One liberated from a prisoner of war camp.

Lily. The pontoon-floated airstrip developed by the British.

loafer. A shoe for informal occasions. (-1944)

Loran. A device employing radar which acts as a Long Range Aid to Navigation.

Manhattan Project. Code name for the atomic bomb project.

May Day (Fr. M'aidez, "help"). Call for help.

meateasy. Place where black market meat could be bought.

Mickey Mouse money. Valueless Japanese money in the Philippines.

Micky. U.S. nickname for a radar bombsight which makes accurate bombing through the clouds possible. (1944)

Mixmaster. Anny bomber propelled by two rear counterrevolving propellers. Made by Douglas Aircraft Co., Inc.

Mulberry Harbour or Port. Artificial harbour used on D-day. (1944)

MVA. Proposed Missouri Valley authority. (1944)

narco-synthesis. A method of treating a neurosis by working with a patient while he is under the influence of an injection of sodium pentathol. (1943)

Neptunium (after the planet Neptune. Cf. Century Dictionary and Cyclopedia, 1911. s.v. neptunium: "A supposed new element announced by Hermann in 1877 as present in columbite and ferro-ilemite. Its existence has not been confirmed."). Element Number 93, produced when uranium 238 takes on a bombarding neutron. This absorption causes the uranium to emit an electron, the emission changing a neutron into a proton. The element is not found naturally.

PCAU. Philippine Civil Affairs Unit.

pedal pusher. Knee-length trousers for girls. (1944)

Periston. Ersatz blood plasma, developed by the Germans.

pinpoint. To determine precisely; to give highly specialized training to, as, "to pinpoint the training of students." (Probably an extension of *pinpoint*, as in "to pinpoint bombs.")

PLUTO. From the initial letters of Pipe Line Under The Ocean, a gasoline line under the English channel.

Plutonium (after the planet Pluto). Element Number 94, which results when the radioactive neptunium breaks down with the emission of an electron which changes one of its neutrons into a proton. The element is not found naturally.

pre-atomic. Before Aug. 6, 1945, the date of the atomic bombing of Hiroshima.

Precipitron. Trade name of a machine made by Westinghouse Electric and Manufacturing company for purifying air by the electronics principle. (1942)

PRECO. United Nations Preparatory commission.

PREWI. Press Wireless, Inc. (1944)

Projected Books, Inc. A nonprofit group formed to furnish books on films to veterans and patients unable to use their hands. (-1944)

proximity fuse. A radio-operated fuse built in the tip of a projectile which explodes the projectile at that distance from the target where its flying fragments will do most damage. Developed by the army and the navy.

Red Ball Highway. A system of highways set up in

France to expedite the movement of war materials to the fighting fronts. (1944: red-ball is an old railroad term for a fast freight.)

redeploy. To move fighting men from one front to another, used to describe the shifting of U.S. troops from Europe to the Pacific. Redeployment, n.

returnee. One who has returned, as from a fighting front. (1944)

ruptured duck. Identification button for discharged U.S. servicemen.

Schnorkel (also Snort). Device of the Germans which enabled them to keep their submarines under water for many weeks. An air pipe, when extended above the surface of the water, enabled the submarine to recharge its batteries and exhaust its fumes while remaining submerged. (1944)

selevision. The selling of citrus fruits by telegraph.

separate. To discharge or release from active duty in the armed services. Construed with from. (-1944)

separatee. One who has been separated from the armed services. (1944)

separation centre. A centre where U.S. servicemen were sent for discharge or release from active duty. Sometimes separation was accomplished by sending only the individual's records to the centre. (1944)

set-aside, n. Materials, such as meat, canned goods and vegetables, set-aside by order of the government for its use.

Shooting Star. Trade-mark of the Lockheed P-80 jet plane. (1944)

Silicones. A group of synthetic resins developed by Dow-Corning Corp., which resist water and high temperatures. (1944)

sitting duck. Something extremely easy; as easy to hit as a sitting duck. (-1944)

Skycoupe. A pusher-type monoplane for two occupants planned by Piper Aircraft Corp.

Skycycle. A monoplane for a single occupant designed by Piper Aircraft Corp.

sky-hook. Apparatus for dropping packages from planes by spinning them and thus controlling where they fall. (1944)

skymarker bomb. Bombs dropped to locate targets hard to find. It leaves a trail of coloured smoke which lasts five minutes and which can be seen by a plane five miles away.

Skysedan. Plane for four occupants designed by Piper Aircraft Corp.

squawk box. Loud speaker on board a ship. (1944)

stateside. Pertaining to the United States; in or toward the U.S. (1944)

Stratocruiser. Trade-mark of a four-motored plane built by Boeing Airplane Co., designed either for passengers or freight, cruising at 340 m.p.h. at a ceiling of 30,000 ft. and carrying 80 or more passengers or 35,000 lb. of freight. (1944)

Strato-suit. A suit, pressurized and heated by electricity, which makes it possible for flyers to be comfortable at altitudes as high as 80,000 ft. Oxygen is supplied through a special headpiece. Maj. John B. Kearby and the B. F. Goodrich Co. developed the suit.

Stratovision. Method worked out by Westinghouse Electric and Manufacturing company and Glenn Martin of using planes in the stratosphere to broadcast television.

streptomycin. A drug related to penicillin. (1944) sub-sonic. Speeds ranging up to that of sound.

suicider. A suicide. (1943)

super-dumbo. A B-29 Superfortress used in air-sea rescue work.

superseniority. Job seniority for veterans which superseded all other seniority except that of another veteran in the same class. (1944)

supersonic. Speeds above that of sound.

talking book. A recording of a reading of a book; for use by the blind.

TCP. Trichlorophenoxyacetic acid; a weed killer.

1080. Sodium fluoroacetate, the 1,080th substance examined in a search for a new rat poison.

terminal leave. Accumulated leave given an officer in the U.S. services immediately prior to his release from active duty. In 1946, terminal leave pay was voted by congress to nonofficers for unused leave.

terror bombing. Deliberate bombing for terror effects with hope of shortening a war.

test-fly. Make a test-flight of a plane. (-1944)

top secret. A security classification used by the armed forces and the diplomatic corps to denote information or matériel of the utmost secrecy.

trans-sonic. Speeds in the range of that of sound (roughly 600–900 m.p.h.).

trusteeship plan. A plan for handling the mandated territories of the League of Nations and those newly acquired territories which might need to be controlled internationally after World War II. A council composed of nations which formerly held mandates and a like number of those which did not, would exercise control over territories voluntarily submitted to trusteeship. (1939)

TWI. (Training within Industry.) A War Production board program. (1944)

2,4-D. Laboratory designation of a synthetic hormone which destroys weeds without hurting the grass. Developed by the U.S. department of agriculture and others.

UNCIO. United Nations Conference for International Organization.

under wraps. Censored, secret.

USAFI. (United States Armed Forces Institute.) This institute supplied war department correspondence courses for service personnel, sending the courses even to remote areas. It also assisted service men and women in getting extension courses from the college or university of their choice. (-1943)

USFET. United States Forces in the European Theatre, with headquarters at Frankfurt, Germany.

USIBA. United States International Book Association, set up to aid in the distribution of U.S. books abroad.

VIP (also Viper). Very Important People (usually, in the army). (1943)

Viper. A rocket-propelled plane designed by the Germans to break up formations of United States bombers. The pilot, after having directed the plane, would parachute to safety.

Vista Dome. A glass-enclosed section, slightly raised above the top of a railway coach to enable its occupants to see in any direction; designed by General Motors.

volcano bomb. An 11-ton bomb made and used by the British. Also called town-buster.

Volkssturm (Ger. Volks, of the people+Sturm, troop). Army made up from the people; home guard. (-1943)

VT fuse. See proximity fuse.

war-weary plane. A plane beyond repair; also, one whose great damage required it to be sent home for repairs.

werewolf. Member of a German underground organization opposing the Allies.

wingman. The second of two planes, to one side and behind the leader, to protect the latter's tail. (-1945)

Zaibatzu (Jap. zai, wealth+batzu, clique). The group which controlled most of Japan's industry.

zeroed in, to be. In artillery fire, to have the exact range. (1944; to zero, -1925.) (I. W. R.; X.)

1946

The continuing importance of physics (especially electronics) in the creation of new words was noticeable in 1946. In aviation and medicine, also, the influence of science on word coinage was evident. In the nonscientific field an indication of postwar problems could be seen in such terms as buyers' strike, 52-20 club and iron curtain.

* * *

Able day. See A-day.

A-day. Short for Atomic day, June 30, 1946 (July 1 Bikini time), when the fourth atomic bomb was dropped in a test at Bikini to determine its effect on a fleet of war vessels. Also Able day, from "able," the signaller's word for "a."

aeropulse. A type of jet-propulsion motor in which the air sucked in from the atmosphere is let into the combustion chamber through shutters equipped with springs which open and close with a pulse-like movement.

americium. Element number 95, named by Glenn T. Seaborg for the two Americas.

A.S.V. air-to-surface-vessel, a radar device able to detect vessels on the surface of the water. (1945)

athodyd. See ramjet.

atomic cloud. The mushroom-shaped, radioactive cloud formed by the explosion of an atomic bomb.

bacitracin. An antibiotic substance for use against many bacteria, including those that cause pus and blood poisoning. It was first isolated in a wound of Margaret Tracey, after whom it was named. (1945)

Baker day. The day on which the second atomic bomb of Operation Crossroads was to be set off beneath the surface of the water in the midst of a fleet. So called after the signaller's word for "b," See Able day.

banana money. Japanese currency, so named because it bore the design of a banana. (1945)

Bat (bomb). A glider bomb, containing radar in its tip, which, launched from the wing of its mother ship, is electronically guided until it hits its target. It was developed by the U.S. navy and the Bell Telephone laboratories. (1945)

be-bop. Slang. Name of uncertain origin—possibly from a similar sound made on the trumpet—to describe a development of swing music which was unrestrained, unrehearsed, high-note and dissonant; possibly imitative of Igor Stravinsky. (1945)

benzene hexachloride. See 666.

Bloc(k). Code name for a television transmitter attached to a plane which enables one to see what is going on 200 mi. away. It was developed by the U.S. navy in co-operation with the Radio Corporation of America and was used in life saving and in actual battle.

boom-and-bust, n. A cycle of economic inflation and deflation. (-1946)

brideship. A ship carrying a large number of brides of servicemen.

Bungalow Biddy. See Tournalayer.

buyers' strike. A movement by consumers to force prices down by not buying. (-1946)

Calutron. A word composed from California university cyclotron to describe an electrical machine that classifies atoms on the basis of their weight differences. It is manu-

factured by the Westinghouse Electric corp. (-1945)

carbon 14. A radioactive substance of great promise as a synthesizer of food and fuel and as a tracer in biological research.

caretaker, adj. Pertaining to something temporary; stop-

gap; as, a "caretaker government." (1945)

chalk. 1. Information, often posted in chalk on slates or blackboards, concerning the odds in horse-race betting. chalk favourite. A horse favoured to win. (-1936) chalk player. One who waits for the last writing or posting of prices or odds so that he can play the favourite. (-1934); also chalk eater (-1942) 2. Hence, by extension, a favourite in horse racing as indicated by such information or "chalk." (-1946)

Chromovox. An electric machine devised by Herman R. Goldberg to help teach the deaf to talk by associating voice sounds with certain colours.

cuddle seat. A contrivance for carrying small children consisting of a seat hung from a strap slung over the shoulder. It was introduced into the U.S. by Australian war brides.

curium. Element number 96, named by Glenn T. Seaborg for Pierre and Marie Curie.

cyclophon. A tube used in pulse time modulations (q.v.). DANA. Initials of the *Deutsche Allgemeine Nachrichten Agentur* (German General News agency), sponsored by U.S. newspapermen as a successor to the DNB.

Doron. A glass-cloth armour, named for its inventor Brig. Gen. G. F. Dorion, impervious to bullets as large as .45 calibre. (1945)

drone. A plane handled by remote control from a control or mother ship (q.v.). (-1946)

echo. A radar wave which has been reflected from an object. It makes a pip (q.v.) on a radar screen. (1941)

electropult. A small car, something like a trolley, provided with a 1,400-ft.-long track and capable of developing sufficient speed (120 m.p.h.) within 500 ft. to launch a plane.

elevon. A combination elevator and aileron located in the trailing edge of the wing of a flying wing.

ENIAC. Electronic Numerical Integrator and Computer, a machine invented by John W. Mauchly and J. Presper Eckert which can solve difficult mathematical problems with great rapidity. (-1946)

Exercise Musk-Ox. A U.S. expedition into the subarctic and arctic regions to obtain scientific data. See operation.

existentialism. A pessimistic literary-philosophic doctrine in France which denied the value and significance of human existence. Jean-Paul Sartre was its chief proponent. (1945)

fact finder. One engaged, as in a labour dispute, to ascertain the facts of a case. (-1945)

52–20 club. The veterans of World War II who, rather than take low-salaried jobs, accepted the \$20 a week unemployment compensation the government would pay for a year (i.e., 52 weeks).

fissionable, adj. Pertaining to that which is subject to fission. (-1946)

Flying Ram. The U.S. army XP-79, a small jet-propelled flying wing made by Northrop Aircraft Co. Fourteen feet long, with a wing span of 38 ft., it was flown at speeds of more than 500 m.p.h. by a pilot in a prone position. The plane was welded into a simple magnesium sheet strong enough to withstand the ramming of enemy planes.

flying stove pipe. See ramjet.

Gapa. Short for "ground-to-air pilotless aircraft," a guided missile of the U.S. army air forces. It is a thin, rocket projectile, ten feet long, to be used against enemy missiles before they strike. Manufactured by the Boeing Aircraft Co.

G.C.A. Ground control approach, a radar-operated system in which a ground operator "talks in" (q.v.) a plane that must make a blind landing. (1945)

gray market. A modified black market.

guided missile. A missile directed by some means of remote control such as radio, radar or television. (-1945)

hoppicopter. A flying machine invented by Horace T. Pentecost which operated on the principle of the helicopter. Its source of energy was a 20-h.p., 2-cylinder engine, attached to the back of the pilot. (1945)

hot, adj. Pertaining to objects which have been made radioactive.

huckster. Slang. A radio advertising man. (-1946)

Huff-Duff, n. Pronunciation given by servicemen to the initials (HF DF) of "high frequency direction finder," a device which could determine the location of such objects as ships and aeroplanes as far away as 3,000 mi. Through Huff-Duff, lost planes and ships could be told where they were. It was developed by the U.S. navy and the International Telephone and Telegraph Corp.

Huks. Shortening of Hukbalahaps, a Tagalog word meaning armed peasants, people's army. (1945)

hydrobomb. A 3,000-lb. aerial torpedo with an explosive charge of 600-1,250 lb., built to withstand launching speeds as high as 350 m.p.h. In the water it is rocket-powered accurately at 40 knots.

IFF. Identification, friend or foe, equipment carried in an aeroplane which is sensitive only to corresponding sets, in another plane or on the ground, using a prearranged code. (1945)

iron curtain. (1) The supposed impenetrable censorship and secrecy dividing soviet-dominated Europe from the remainder of the world. Attributed variously to Winston Churchill and to William Joyce (Lord Haw-Haw). (-1946) (2) Any such curtain.

Mad Operator. Slang. Navy nickname for the magnetic air-borne detector which enabled aeroplanes to locate submerged submarines.

missile. Specif. Mil. Term that includes the whole class of pilotless, jet-propelled projectiles.

mop. Slang. A word connoting surprise; a mild sort of "hubba, hubba, hubba." (1944)

mothered, pp. Controlled by a mother plane.

mother ship. An aeroplane whose pilot controls a drone or push-button plane. Also mother plane (1945), worker plane.

mycocidin. A substance obtained from mould in the aspergillaceae family, of promise in the treatment of tuberculosis. Developed by Drs. Isadore F. Gerber and Milton Gross.

Navar. A system developed in the International Telephone and Telegraph Federal Telecommunications laboratories of controlling air navigation and airport traffic from centres containing screens on which electronic images enable a control officer to determine the position of all aircraft within a radius of 80 mi. (-1946)

operation. During the years 1939–46, new specific combinations of this word, too numerous for inclusion, occurred. (1) Such specific military uses as Operation Neptune (the naval aspect of the invasion of Normandy) to describe a campaign involved a sense of the word dating from 1749. (2) As a rehearsal, the term apparently went back to World War I; a new specific combination involv-

ing this sense was seen in Operation Crossroads, the atomic bomb test at Bikini. (3) Under the influence of the many combinations in senses 1 and 2, operation was employed to cover any specific plan or project, especially nonmilitary. Thus, Operation Dixie described the plan of the C.I.O. to organize the south; Operation Friendship was a plan of the British Travel assn. to cement friendships made in England between Americans and Englishmen.

orbit rocket. A theoretical rocket which could be sent out into space, where it would be made to act as a satellite until such time as it might be directed at an enemy.

paludrine. An antimalarial drug developed by English investigators from coal tar. (1945)

performance-observer method. A method to keep horse racing honest. For each entry in a race an observer is appointed who watches the race through binoculars to which is attached a microphone connected with a recorder to make a record of his remarks during the race. (1945)

pip. The indication of an echo (q.v.) on a radar screen. (-1945)

Plesianthropus. An "almost man," some of whose skeletal remains were found by Dr. Robert Broom not far from Johannesburg, South Africa. (1945)

pregnenolone. A synthetic chemical, daily doses of which improve human performance by counteracting fatigue. (1945)

psychodrama. A kind of play invented by Dr. J. L. Morens for neurotics. The patients resolve their neuroses by extemporaneously creating and acting out before their fellow patients the type of situation they fear to face in actual life. (1945)

pulse time modulation. A method of using microwaves whereby a number of phone conversations can be transmitted over a single wave band. Abbrev. **PTM**.

push-button, $ad\bar{j}$. Pertaining to the remote-control made increasingly possible by developments in the field of electronics; as, a push-button plane, push-button war. (1945)

radar scope. (1) Short for radar oscilloscope, a machine for viewing the images produced by radar. (2) A radar screen. (-1946)

radar screen. A fluorescent screen at the end of the radar scope on which the pips are indicated. (-1946)

radioisotope. Short for radioactive isotope.

ramjet. A jet-propulsion unit without moving parts which operates on a continuous stream of air which is compressed by the speed with which the unit "rams into the air." The higher the speed, the greater the compression and hence the efficiency. Also called athodyd and flying stove pipe.

raticide. See rodenticide.

Red Feather. The symbol of the Community Chest.

ribbon city. A city about a mile wide built along a highway. Also strip city.

Ring. Code name for a large, free-moving, air-borne television transmitter capable of relaying pictures as far as 200 mi. It was developed by the U.S. navy in cooperation with Radio Corporation of America and was used in lifesaving and in actual battle.

rodenticide. A rodent killer. (1945) Also raticide.

Sferics. Short for static direction finders, the U.S. army's electronic system for obtaining information on weather conditions; reliable for distances up to 3,000 mi. (1944)

Shock wave. A wave resulting from the fact that as a plane approaches the speed of sound, the air flows over the rear of the wing more slowly than the front, causing shocks that affect the lifting efficiency of the plane and

eventually batter it to pieces. (1945)

Shoran. Short for "short-range radar," a radar device which uses high-frequency radio waves sent from a plane to ground stations to locate and measure by miles or

feet any spot on the earth. Used during World War II to bomb targets through an overcast, it may be used in peacetime for mapping unknown areas. Developed by the Radio Corporation of America. (1945)

sitter. Short for baby sitter (1937), one, usually a teen-

age girl, who sits with a baby while the grown-ups are out. (1944)

666. An insecticide (hexachlorobenzene) for intestinal parasites. (1945)

Skimobile. A mechanical chain of cars used to pull skiers up a mountain.

SN 7618. A synthetic drug (7-chloro-4-[4-diethylamino-1-methylbutylamino] quinoline) said to excel atabrine or quinine in the treatment of malaria. So called because it was the 7.618th substance tested.

snake. Nickname of a device used during an army's advance to destroy wires and detonate mines.

sniperscope. A U.S. army detection device, attached to a .30-calibre carbine, for sighting objects in the dark. Infrared rays, shot out by electronic equipment powered from a source on sniper's back, hit an object, an image of which is reflected on a screen. Soldiers thus sighted were unaware of the fact. It was manufactured by Electronics laboratories of Indianapolis, Ind.

snooperscope. A U.S. army detection device, operating on the same principle as the sniperscope, which can be attached to a soldier's helmet to enable him to see, or be used by leaders for signalling. It was manufactured by Electronics laboratories of Indianapolis, Ind.

snowmobile. Term applied also to a light tank, equipped with a glass cabin and rubber tracks in which particles of steel are imbedded for traction. (1943)

Sofar. An underwater sound system, called "Sofar" from sound fixing and ranging, developed by the U.S. navy and the Oceanographic institution, Woods Hole, Mass., which made possible the location of air and ship survivors as far as 2,000 mi. from shore and thus facilitated sea rescue.

sono-radio buoy. A buoy equipped with hydrophones which pick up sound waves from a submerged submarine and convert them into radio waves for transmitting to aircraft or surface vessels. Also sonobuoy. (1945)

stacking, n. The assigning of planes to certain altitudes, say, 1,000 ft. apart, especially over an airport when landings are delayed by bad weather conditions. As the bottom plane lands, each member of the stack drops 1,000 ft. and a new plane can then be brought in on top. Also stack up, n. (1943)

synchrotron. A new 300,000,000 electron-volt atom smasher devised independently by Prof. V. Veksler (U.S.S.R.) and Prof. Edwin M. McMillan (U.S.). (1945)

talk down, v.t. To aid a pilot to land a plane in overcast weather by studying the position of his plane on a ladar screen and giving him directions. Also talk in. (1948)

target-seeking missile. A missile, equipped with a targetseeking mechanism, which is attracted toward its target when it approaches its vicinity.

Tournalayer. A huge machine, made by R. G. Le-Tourneau, Inc., which can "lay" a 24 ft. x 30 ft. 4-room concrete house in 24 hr. Also called Bungalow Biddy. The poured concrete houses are called Tournalaids.

transuranic, adj. Pertaining to elements beyond, that is,

heavier than, uranium. (1945)

Truman bread (flour). The bread made from 80% wheat flour, adopted in April 1946 to make it possible to send more wheat abroad. The measure was temporary.

truth serum. Popular name for sodium pentathol, under the influence of which an individual will disclose the truth he has been suppressing. (-1946)

velvet curtain. Term used by the U.S.S.R. to describe British secrecy in British-occupied Europe and the middle east

Wac corporal. A rocket, 16 ft. in length, 12 in. in diameter, weighing 600 lb.-1,000 lb., the nose of which contains weather instruments to determine various facts about the ionosphere at an altitude of about 43 mi. So called from its slim and graceful appearance.

wave guide. Hollow pipes through which radio waves

weaponeer. The person who prepares an atomic bomb for dropping by the bombardier. (1945)

window, n. An antiradar device consisting of strips of aluminum toil one-half the length of a radar wave which, when scattered from a plane, confuse the enemy radar operator by producing a number of echoes on his screen. Also called chaff, shaff.

wire recorder. An electrically operated machine for recording sound on a thin aluminum wire strung between two spools, one of which winds and the other unwinds. The recording can be heard as often as desired, or it can be rubbed off and a new one made on the same wire. (-1943)

worker plane. See mother ship.

X-M bank. The Export-Import bank. (-1946)

World Federation of Trade Unions

The World Federation of Trade Unions was founded at a conference held in London in Feb. 1945 and met in Paris to adopt its constitution and hold its first formal congress in Oct. 1945. It was a much more inclusive body than existed before World War II, when the world trade union movement was split between two rival bodies, the (Amsterdam) International Federation of Trade Unions, representing chiefly western Europe, and the (communist) Red International of Labour Unions, consisting mainly of

the soviet trade unions, with smaller groups from other countries. There was also a separate International Federation of Christian Trade Unions, representing movements in a number of countries, mostly with a fairly small membership. A good many national trade union bodies were not affiliated to any of these internationals. Attached loosely to the I.F.T.U. were a number of trade secretariats, or international federations of particular bodies of workers; e.g., transport workers, miners, textile workers, commercial employees.

The W.F.T.U. was initiated chiefly by the British and soviet trade unions, which had established a wartime joint committee, in consultation with the U.S. Congress of Industrial Organizations. The conservative American Federation of Labor, with which the British T.U.C. had a joint committee, had lately joined the I.F.T.U., but refused to take any part in forming the W.F.T.U. The Confederation of Latin American Workers, representing most parts of South and Central America, took part in forming the W.F.T.U., as did the American Railroad brotherhoods and the main body of Canadian trade unionists. In all, the Paris conference had representatives from the trade union movements of 56 countries, as compared with 37 at the earlier London conference. The number of members represented was roughly 67,000,000, of whom nearly 30,000,000 were in the soviet union, as against 7,000,000 for Great Britain, 6,000,000 for the C.I.O., and so on, down to very small numbers in some countries. The constitution laid down a system of voting and of representation on councils and committees which prevented the larger movements from exercising a preponderant control. At the congress, each national affiliated group was entitled to at least one delegate, and thereafter, up to 5,000,000 members, to one delegate for each 250,000; but beyond this figure the number of delegates was tapered off. A similar system was applicable to the general council, which was to meet at least once a year and to include at least one delegate from each country. For the smaller executive committee countries were grouped for purposes of representation, as follows: three members each for the soviet union, U.S.A. and Canada; two members each for Great Britain, France and Latin America; one member each for the near and middle east, China, India and Ceylon, Australasia, Africa, Scandinavia, western Europe, southern Europe, central Europe and southeast Europe. In addition, three members were to be chosen by the trade secretariats, and the secretary-general was to be a member. The affiliation dues were graded, to reduce the per capita sums payable by the very large bodies.

The W.F.T.U. put forward a claim for direct representation on the assembly and on the economic and social council of the United Nations. This led to considerable difference of opinion, the U.S. strongly opposing the claim. It was finally decided that the W.F.T.U., the International Co-operative alliance, and other suitable organizations, including by name the American Federation of Labor, should be associated in a consultative capacity with the economic and social council.

The W.F.T.U. at its 1945 congress adopted a comprehensive plan of world economic reconstruction providing for the universal adoption of policies of full employment and social security, for full trade union freedom and participation in the planning and control of industry, for the elimination of all "economic or social discrimination based on race, creed, colour, or sex," and for international arrangements to promote trade and orderly migration.

World Political Alignments, Postwar

When the greatest of all wars and the second world war in a generation came to an end Sept. 2, 1945, two fundamental concepts underlay the emerging pattern of postwar political alignments. The first, adopted in the United Nations' declaration of Jan. 1942 as the policy of the alliance that was to defeat the axis, was based on the concept of One World and was to find its realization in the United Nations organization as the international authority to preserve peace. The second, referred to as the realistic concept and born of national self-interest, was based on a world divided into already-existing spheres of security, such as the U.S., the British and the Russian, and was to find recognition in bilateral treaties and in articles 52, 53 and 54 (regional arrangements) of the United Nations charter.

One World v. Regional Spheres.—These two concepts were reconciled by their amalgamation in the United Na-

tions charter signed by 50 nations June 26, 1945, in San Francisco. The United Nations charter admitted to the organization all members of the coalition on a basis of sovereign equality irrespective of their military alliances, regional ties, or status of sovereignty. Adherents to the One World idea hoped that as the United Nations grew in strength, it would gradually eliminate the rival concept by making security blocs unnecessary as a prop for peace, at the same time recognizing their temporary necessity.

Supporting this point of view, U.S. Secretary of State James Byrnes, in an address in New York city on March 1, 1946, stated: "We (the United States) will gang up against no state. We will do nothing to break the world into exclusive blocs or spheres of influence. In this atomic age we will not seek to divide a world which is one and indivisible." Emphasizing that the foreign policy of the British commonwealth and empire was based on the United Nations and not on rival security spheres, Foreign Secretary Ernest Bevin said in a speech to the Labour party conference June 12, 1946: "I have deliberately not pressed for an alliance with France or the Western Powers because I have been actuated all the time in this approach not to divide Europe."

On the other hand, adherents to the concept of security spheres looked to the balance of power between blocs of states to keep peace in the final analysis and, while supporting the United Nations as a forum in which the power of these blocs could be tested, concluded bilateral security pacts. For example, the soviet union negotiated treaties with Czechoslovakia, China, France, Poland, Yugoslavia and Britain.

Victors and Vanquished.-Emanating from World War II, in addition to these two concepts which underlay the emerging pattern of postwar political alignments, was the fact of the alignment of the victors on one side, the vanquished on another and the neutrals grouped in a third cluster by virtue of their neutrality. The victorious coalition was comprised of 50 nations who had declared war on either Germany or Japan or both.1 The vanquished were Germany, Japan, Italy and the axis satellites-Rumania, Bulgaria, Hungary and Finland. The neutrals were Sweden, Switzerland, Eire, Spain and Portugal. Finally, there was Denmark, which alone among the axis-occupied countries had neither collaborated with Germany nor established a government abroad. Of these, in considering alignments, the obvious fact was that the vanquished were not permitted to align themselves, and the neutrals were of such a scattered nature as to have no basis for postwar coalition. However, the neutrals, with the exception of Spain, would early become members of the United Nations (substantially synonymous with the victorious alliance). It remained to be seen whether such an alignment of nations bound together by a common enemy could continue in time of peace with the only binding force the will to peace. The victors comprised such a vast percentage of the area and population of the world that the effect of a continuation of this alignment would be to remove the bond of an external threat and thereby increase the divisive influences within the coalition. The United Nations charter attempted to remedy this by substituting the very real but impersonal enemies of want, ignorance, injustice and intolerance. Complicating the peacetime existence of this warborn alliance was another factor. Except in war, the victorious nations had not been united. In fact, in 1938, England and France had signed a nonaggression pact with Germany at Munich in which they gave their consent to a partial occupation by Germany of the territory of Czechoslovakia, their ally. As late as 1941 the U.S.S.R. was member to a nonaggression pact with Germany which had been already at war with England and France for two years. The real hope for peace, therefore, was whether an alignment formed during World War II, and without any prewar basis, could exist postwar.

The most significant postwar alignment was that of the soviet union with the countries following it on the one hand, and the alignment of the United States and the countries following it on the other. The first date on which this division in alignment became openly evident was April 30, 1945, just prior to the end of the war with Germany. The occasion was the vote in the United Nations conference at San Francisco on the question of the admission of Argentina to the conference. By a vote of 31-4, Argentina was invited by the United Nations to attend the conference despite repeated requests by the U.S.S.R. that Argentina be omitted until the Polish government in Warsaw was invited. The 14-nation executive committee voted 9-3 to invite Argentina; the U.S.S.R., Czechoslovakia and Yugoslavia voted against, with China abstaining. The steering committee voted 29-6 to invite, with Czechoslovakia, Yugoslavia, Belgium, Greece, New Zealand and the U.S.S.R. in the minority. In the plenary session the final vote showed the U.S.S.R., Yugoslavia, Czechoslovakia

and Greece voting in the minority.

Colonial v. Noncolonial Powers.—Another significant issue which had come to the front as a basis of postwar political alignment was the question of the attitude of colonial and noncolonial powers to dependent peoples. Since no trusteeship policy had been formulated by the United Nations prior to the San Francisco conference, the first evidences of alignment on this issue took place at this time. Contrary to what might have been expected, the colonial powers—Great Britain, France, the Netherlands, Portugal, Belgium and the United States—did not always line up against the noncolonial states.

In general, however, China, whose future interest was related to the independence of dependent peoples in Southeast Asia; Australia, New Zealand, Egypt, Iraq, Syria, the Philippines and India, all of which had been dependencies; and U.S.S.R., whose vast empire was without overseas possessions, were sympathetic to the aspiration for independence of colonial peoples. Nevertheless, despite this cleavage in alignment between the colonial and noncolonial powers, the former accepted for the most part the provisions of the United Nations charter regarding trusteeship. They provided no change in the status of colonies except by consent of the colonial powers themselves. Some proof of the good faith with which the colonial powers ascribed to the spirit of the charter's trusteeship provisions was evidenced by the fact that within the year the world's leading colonial power, Great Britain, had agreed to place under United Nations trusteeship its mandated territories Tanganyika, Togoland and Cameroons and to give Trans-Jordan and India their independence. Following this lead, Belgium agreed to place its African mandate, Ruanda Urundi, under United Nations trusteeship; Australia, its mandates of Nauru and New Guinea; New Zealand, its mandate Western Samoa; and the Netherlands indicated that Indonesia would have the opportunity for self-determination "in our time," in the meantime offering to establish a commonwealth of Indonesia under which all Indonesians would enjoy citizenship and civil rights in all parts of the Netherlands kingdom. On the other hand, France showed reluctance to place its African mandates-French Togoland and French Cameroun-under United Nations trusteeship, and the Union of South Africa expressed an interest in establishing sovereignty over its mandate of South-West Africa. The French cabinet approved a plan to give French Indo-China autonomous selfgovernment within a French federal union. This was in keeping with the pledge given by the French Committee of National Liberation on Dec. 8, 1943, which promised Indo-China "a new political status within the French community."

Russia and the Veto.-Other political alignments issued from the debates in the San Francisco conference, but none was as fundamental as the cleavage on the question of the veto power. The soviet union took the position that the five great powers-China, France, Great Britain, Russia, the United States-should have the right to veto not only the investigation of any dispute and decision to take enforcement action with respect to it, but also the discussion of any dispute at any stage. The formula for voting established at the Crimea conference in Feb. 1945 distinguished between procedural decisions and decisions on other matters. On procedural matters, decisions were to be reached by an affirmative vote of any seven members, permanent or nonpermanent. On all other matters, decisions were to be reached by an affirmative vote of seven members, including the five permanent members. In other words, the five permanent members had what was referred to as

⁴Argentina, Australia, Belgium, Bolivia, Brazil, Byelorussia, Canada, Chile, Colombia, Costa Rica, Cuba, Czechoslovakia, Dominican Republic, Ecuador, Egypt, El Salvador, Ethiopia, France, Greece, Guatemala, Haiti, Honduras, India, Iran, Iraq, Lebanon, Liberia, Luxembourg, Mexico, Netherlands, New Zealand, Nicaragua, Norway, Panama, Peru, Paraguay, Philippines, Poland, Arabia, Syria, Ukraine, South Africa, U.S.S.R., United Kingdom, United States, Uruguay, Venezuela, Yugoslavia.

"a veto power." While the lesser powers-the so-called "little 45"-reluctantly conceded the right of the permanent members of the Security council to veto enforcement action, they fought to remove all other matters from the scope of the great powers. Especially, were they determined that the great powers should have no veto over discussion of any dispute. Great Britain and the United States sided, in general, with the "little 45," taking the view that all members of the Security council should be free to discuss any dispute threatening international peace. On June 7, 1945, it was reported that Stalin had instructed the soviet delegation to abandon its request for a veto over discussion of international disputes. Once this was done and the 22 questions concerning the veto power asked by the "little 45" had been answered, the Yalta formula was incorporated in Article 27 of the charter. Despite the conciliatory attitude shown by the U.S.S.R. at this critical juncture in regard to the veto power, the division between the U.S.S.R., Czechoslovakia, Byelorussia, Ukraine, Yugoslavia and Poland on the one hand, and the other United Nations on the application of the veto was the central thread of the major alignment of countries following the U.S.S.R. and the countries following the United States. An example was the rejection by the soviet union and the countries following it of the United States' plan for control of atomic energy involving the outlawing of the veto as it pertained "to protect those who violate their solemn agreements not to develop or use atomic energy for destructive purposes."

The period following the prefatory alignments of the San Francisco conference had been marked by the ascendancy of the so-called realistic concept emphasizing regional political alignments within the great powers' spheres of security. Some of these dated back to periods long before World War II but received fresh impetus during the postwar period. The reason for the revival of the balance of power policy between regional spheres was the fact that there was no power in the United Nations charter to enforce decisions against a major power and no immediate prospect of general disarmament.

Four Regional Blocs.—What blocs or regional spheres came into existence in political alignment in this postwar period?

Inter-American System.—The Inter-American system had no formal recognition in a written charter. Though the Pan American union had been in existence since 1890, only since the Act of Chapultepec (1945) had the Inter-American system begun to assume the appearance of a regional security sphere. Part I of the act laid down the procedure American states were to adopt in the face of aggression, including the application of economic sanctions and the use of armed force during the period of war. Part II provided that for the postwar period a treaty be negotiated which would establish similar procedures for the time of peace. A proposed Inter-American conference for such a purpose scheduled to be held in Oct. 1945 was postponed when the United States state department announced on Oct. 2, 1945: "In view of recent developments in Argentina, the United States government does not feel it can properly negotiate or sign with the present Argentine government a treaty of mutual assistance." Part III contained the proviso that defined the relationship of the Inter-American system to the United Nations. It stated that regional arrangements should be "consistent with the purpose and principles of the general international organization when established." Twenty American states adhered to the Act of Chapultepec at the close of the Mexico City conference March 8, 1945. Argentina had not been invited. However, the Pan American union governing board unanimously approved a motion to open the final act of the Mexico City conference to Argentine admission on April 4, 1945. Besides the Act of Chapultepec, a resolution was passed on "reorganizing, consolidating and strengthening the Inter-American system." In the future, International Conferences of American States were to meet every four years, and the ministers of foreign affairs were to meet in every non-conference year with powers to take decisions on situations and disputes of every kind "which may disturb the peace of the American republics." Though the Act of Chapultepec still required implementation in the postwar period by an Inter-American mutual assistance treaty, the conference at Mexico City, 1945, marked the high point in the formulation of a western hemisphere security alignment. One further step was taken later. On May 6, 1946, the United States announced a proposed program for co-ordinating the military forces of the western hemisphere. It was known as the Inter-American Military Co-operation bill and provided for the integrated training of armed forces personnel, the maintenance of military or naval installations in new world countries, and the transfer to these countries of a wide variety of military equipment.

Russian Security Sphere.-During World War II, the U.S.S.R. annexed Lithuania, Latvia, Estonia, eastern Poland, Bessarabia and Bukovina, Moldavia, Carpatho-Ukraine, East Prussia, Karelo-Finland, Petsamo-Finland, Tannu Tuva, southern Sakhalin Island and the Kurile Islands. To secure its frontiers, the soviet union likewise obtained naval bases on Porkala peninsula, Finland, and at Port Arthur in China, together with joint ownership and operation of the Manchurian trunk railway lines. Russia further bulwarked its security by concluding a mutual assistance treaty with Czechoslovakia in Dec. 1943, with France in Dec. 1944, a 30-year pact of friendship with China in Aug. 1945, an assistance pact with Poland in May 1946 and an assistance pact with Yugoslavia in June 1946. In addition, the U.S.S.R. concluded in May 1942 a friendship and assistance pact with Great Britain which Great Britain twice offered to extend from 20 to 50 years. Beyond annexing bordering territory and concluding security pacts, Russia occupied Hungary, Rumania and Bulgariaall former axis satellites.

In the east, the U.S.S.R. exerted influence in Korea, in which it held military occupation of the northern part. In Manchuria, it secured joint ownership and operation with China of the Manchurian trunk railway lines. To the south, the U.S.S.R. sought to expand its security sphere by pursuing its historical objective of warm water ports. At various times after the close of the war, the soviet union asked for partial control of Tripoli, sought trusteeships under the United Nations for Tripolitania and Eritrea, and indicated a desire for military bases in the Dodecanese Islands and the Greek Islands. In March 1945 the U.S.S.R. renounced the Turko-Soviet Pact of Friendship and Neutrality (1925). In June 1945 Russia asked Turkey to return Kars and Ardahan in eastern Anatolia and to support the soviet claim for a revision of the Montreux convention of 1936 which would give the U.S.S.R. a share in the defense of the straits as conditions for renewal of the Turko-Soviet pact. In July 1945 Turkey rejected these conditions. Finally, the U.S.S.R. exerted pressure on Iran, which stood between the soviet union and its desire for ports on the Persian Gulf and Indian ocean. In the northern province of Iran, Azerbaijan, soviet pressure succeeded in establish-

ing an autonomous government friendly to Russia.

Alignment in Russia's security sphere was not based on any real relationship to the have and have-not division talked about between the two world wars. Raw materials studies published by the Brookings institution (World Minerals and World Peace), by the Royal Institute of International Affairs (World Production of Raw Materials), and by the United States Military academy (Strategic and Critical Raw Materials) indicated that no other single political area, except possibly the United States, could in case of necessity become so nearly self-sufficient in the material elements of national power as the soviet union. With the exception of tin, antimony, nickel and tungsten, there were very substantial quantities of practically every other raw material within the soviet sphere of influence. Though oil production might fall below Russia's needs, its petroleum deposits had been vastly increased and other promising areas were yet uncharted. According to the Brookings study, "No longer does Russia depend entirely on the production of the Baku district for its requirements. It is claimed by the Geological survey (U.S.S.R.) that in the Urals and area west to the Volga river, reserves have been indicated of a greater magnitude than those of the Baku district."

Any sort of an expansionist attitude on the part of the U.S.S.R. could not, therefore, be laid down to a lack of raw materials or lack of living space.

British Commonwealth and Empire.—The British Commonwealth of Nations, an association of nations tied by language, custom, race and common interests, represented an alignment of nations which far antedated the post-World War II period but continued to have great influence in that period. It included the United Kingdom, Canada, Australia, New Zealand, South Africa, Newfoundland, British Honduras, British Guiana, India, Nigeria, Kenya, Gibraltar, Malta, Jamaica, Rhodesia and other islands and dependencies. It comprised about a quarter of the habitable surface of the world, and, including India, its population was one-quarter of the world's population. As the king's prime ministers of the self-governing dominions said May 18, 1944: "The British Commonwealth of Nations finds its strength not in any formal bond but.

in the hidden spring from which human action flows."

The strength of the commonwealth's bonds was severely tested during World War II and the postwar period in the Mediterranean, the middle east and the far east. Centre of anti-British agitation in the middle east was Palestine. Britain's mandate since 1922. In the London conference on the Palestine problem Sept. 1946, Britain was trying to reconcile its strategic interests with its promise to the Jews made in the Balfour declaration of 1917 and its promise of independence made to the Arabs in the Mc-Mahon-Hussein agreement of 1915. In the Mediterranean, Egypt was insistent that British troops be withdrawn immediately from Egyptian territory and that the condominium over Sudan by Britain and Egypt be abolished in favour of annexation by Egypt. Britain, for its part, desired to ensure the military security of the Suez Canal Zone, a vital point in the life line to its possessions in the far east. In the far east, the focal point of British concern was India. The long struggle for the independence of India culminated in the British White Paper's proposal of May 16, 1946, for full and unrestricted independence. On August 12, 1946, Viceroy Archibald P. Wavell asked Jawaharlal Nehru, president of the dominant Congress party, to form an interim government. Riots immediately broke out in Calcutta between Moslem and Hindu fac-

The Moslem league's demands for Pakistan were difficult to reconcile with the Hindu, all-India Congress party's demand for a united India free of British rule.

Within and without the framework of the British Commonwealth of Nations, there were political alignments. On Jan. 21, 1944, Australia and New Zealand completed an agreement which provided for subregional consolidation in the south seas. On Nov. 15, 1945, Britain and Canada joined with the United States in a common declaration on atomic energy, marking the first step in the development of international atomic policy. By the Ogdensburg agreement of Aug. 17, 1940, Canada and the United States had already established a permanent joint U.S.-Canada Board of Defense "to consider in the broad sense the defense of the northern half of the western hemisphere." In a speech

Paris conference of foreign ministers of Great Britain, France, the U.S.S.R. and the United States, which opened on April 25, 1946, and closed in July without having reached agreement on the German problem

in London Nov. 25, 1943, Jan Smuts, South Africa's prime minister, suggested the possible erection of a western bloc as the only means by which the British commonwealth might continue to rank as a world power. Winston Churchill, former prime minister of Great Britain, carried forward a similar sentiment in a speech at Zurich, Sept. 21.

"We must build a kind of United States of Europe. . . . There is no reason why a regional organization of Europe should in any way conflict with the world organization of the United Nations.... The first step in the recreation of the European family must be a partnership between France and Germany."

On March 5, 1946, in Fulton, Mo., Churchill had called for yet another political association:

"Neither the sure prevention of war nor the continuous rise of world organization will be gained without what I have called the fraternal association of the English-speaking peoples. This means a special relationship between the British Commonwealth and Empire and the United States of America. . . . The United States has already a permanent defense agreement with Canada. . . . This principle should be extended to all British Commonwealths with full reciprocity . . . eventually, there will come the principle of common citizenship."

The Arab League.-The Arab league (q.v.) came into existence as the first regional organization born of the postwar period. On March 22, 1945, in Cairo, a covenant was signed by Egypt, Trans-Jordan, Lebanon, Syria, Iraq, Saudi Arabia and Yemen binding themselves to co-ordinate their political action, to take common measures of defense and to resort to arbitration and conciliation in cases of conflict.

Intervention in the internal politics of member states was forbidden. Stimulating the drive to Arab unity was the necessity of presenting a common front against extensions of outside control. Anti-western feelings increased during World War II and were brought to a head in the French Lebanese crisis Nov. 1943. Two annexes to the covenant asserted the juridical right of Palestine to independence, and secondly, urged the league to strive for the national realizations of all Arab countries not yet qualified for membership.

The Arabs did not wish to be satellites of great powers. They were entitled to have their own place and proper function within a United Nations system.

Postwar world political alignments posed the fundamental question as to whether the alignment of the United Nations would become stronger than the regional alignments that had developed on the basis of ideologies and geography within the United Nations. It posed the equally fundamental questions raised at the time of the breakup of the Foreign Ministers' conference at London in Sept. 1945: whether the peace of the world would be imposed by dictate of the three great powers, or whether the world would govern itself in the spirit of the United Nations with all the peoples which were members participating in the decisions, or whether the postwar peace would be lost. World War II

The article which follows is divided into seven broad sections which describe the principal political and military events of World War II. The military and air operations have been treated according to three main geographical divisions-Europe, Africa and the near east; China; and the war in the Pacific. Naval operations are described in a separate section, although it is often impossible to draw a sharp line of demarcation between purely military and purely naval action in World War II, particularly in the

I. THE ORIGINS

The years between the two great world wars covered another period in history wherein the struggle for world peace resulted in failure. It was a period during which those who had the power to enforce peace failed to act and during which the aggressors, encouraged by such failure, and heedless of the destruction and human suffering entailed, again took up war and oppression as a means of accomplishing their objectives.

The panorama of the ten eventful years from 1937 to 1946 was so vast, so packed with diverse forces, interests and personalities, so marked by significant political and social developments, that in itself it challenged measurement and description. Yet, no single decade of history can be divorced from the years which led up to it. The decade of 1937–46 represented only the brink and the falls of disaster through which there plunged the weight of all the forces which had been gathered from the many tributaries of the world's ambitions, energies and manifold mistakes

World War I had been sufficiently vast and destructive to induce mankind to search deeply for the means of avoiding another such convulsion. Many objective and high-principled leaders, who devoted all the energies they could summon to the establishment of a form of society which would bring security and peace, arose after that conflict. If there were also men of partisan approach and background, they did not dominate the scene; and it is safe to say that all were so gripped by the full sense of the destructive power of war as to seek honestly and energetically for security. Then, as at later times, there was divergence of opinion as to method.

Then, as after World War II, acute postwar problems arose which had to be dealt with even while the discussion of the form of a world organization was taking place—problems in some instances uncannily like those which

confronted the world after 1945. These problems frequently plagued the general will to set up a form of international organization which would become either a substitute for, or a moderation of, the old methods of achieving security; namely, by alliance, individual action and war.

It was the conflict, probably inevitable, between the concept of individual security and Pres. Woodrow Wilson's doctrine of collective security which compromised the settlement after World War I. They stalked across the entire period between the wars, and finally led to the outright defiance of the League by the axis powers and to virtual abandonment of it by the western democracies. The establishment of the many new small nations had been tied in with the creation of the League as the fundamental basis of fostering European peace. With these new nations and the alterations of boundaries which were necessary to produce them, and without firm adherence to the League on the part of the victors, Germany was left a wide choice of European issues to exploit.

All of the great Allied Powers, including soviet Russia, appeared to have been guilty of the most painful blunders in their vacillation between collective and individual security as the aggressors began their exploitation of Allied disunity, weaknesses and indecision. That vacillation frequently nullified effective action toward peace. It was only in the face of black disaster and the heat of actual armed conflict that unified action was forged.

The Significance of Versailles.—It is to this persistent conflict between collective and individual security and the jockeying it produced among the powers, rather than to the harshness or the softness of the treaty of Versailles in respect to Germany, that one must look for the elements most useful to the aggressors during the 1930–40 decade.

The Versailles treaty attempted to put together French and Anglo-U.S. concepts of a stable world order. France, which sought drastic modifications of Germany's political boundaries, finally settled for military guarantees of the type with which for centuries it had become familiar. These it accepted from Britain and the United States of America in return for the abandonment of its claim to strategic frontiers and of its plan for the dismemberment of Germany.

The resultant treaty, at least in French eyes, presupposed the continuance of English and U.S. military support, which in the end was not forthcoming. France, as a result, never was induced by a basic sense of security to rest its full faith in the League of Nations.

Practically from the instant of the refusal of the United States to support France by a military alliance and the consequent loss of the British guarantee, the essential elements of the whole theory on which the treaty was drafted were taken from under it. The United States refusal to ratify the treaty was a body blow of almost fatal character in itself, considering the part which the assumed adherence of the United States had played in the treaty negotiations. Even France's proposal for an international police force was rejected. The representatives of Great Britain and the United States had been rather well satisfied with the geographical and military positions of their respective countries after World War I. They were disposed to be content with the formal creation of an organization to keep the peace without placing any great emphasis on the methods by which such an organization would be made potent and dynamic. The League without U.S. participation was thus doubly undermined. To make matters worse, after U.S. withdrawal, England quickly

shifted to its old concepts of the balance-of-power and of restricted intervention in European affairs which effectively deterred it from supporting France's proposals to curb the first military gestures of the renascent reich. Instead of Anglo-French integration of policy, there ensued a sort of duel between the two countries resulting in the practically unilateral and highly unsuccessful occupation of the Ruhr by France and the consequent encouragement of Germany to flout the treaty.

The Germans, especially Adolf Hitler, made much of the harshness of Versailles; but in retrospect no serious contention could be held that the political burdens of Versailles were too great for it to bear. The boundaries in some cases were awkward, as for example the Polish corridor; but they left Germany a strong national state, with a chance for complete economic recovery. Considering the conglomeration of races in Europe and the acute sense of security need which German aggression had induced, the territorial solutions attempted at Versailles could not be said to have been unreasonable or vindictive. It is true that the reparations clauses of the treaty were unrealistic, and they played a part together with other factors-most of them of German origin-in inducing the distressful inflation which Germany underwent. The reparations clauses were moderated, however, by successive plans of adjustment; and in the end Germany failed to pay by way of reparations as much as was received by it in foreign loans on which it later defaulted. It is true that the inflation under which Germany suffered and the economic collapse of Germany did serve to destroy the chief prop the German republic had in the way of political support, for it embittered the middle class against the government, and it enabled Hitler to gain ground with his joint denunciation of the republic's leaders and Germany's former

While the economic features of the treaty had serious consequences, the true defect of Versailles lay in the failure of the Allied Powers to move together in the enforcement of the settlement, even after their own moderation of its terms. The truth of the matter became apparent too late, but eventually even to Anglo-U.S. apologists for the alleged harshness of the treaty it became evident that Hitler was grossly overplaying Versailles as a justification for his depredations.

Primary German Responsibility.—Hitler, however, successfully utilized the treaty as a means of gaining power at home and disseminating publicity abroad as to the sincerity of his purposes. It was only on the verge of war that the realization arose that something deeper than modifications of the treaty of Versailles stood between peace and war in Europe. Hitler's reiteration at each crisis he precipitated that he sought no further concessions in Europe finally lost its force.

Prior to World War II, the German standard of living had substantially improved—it was measurably higher than that of the first victims of Hitler's attacks. If there was discrimination displayed by contiguous states against German residents, none of it approached Hitler's charges nor faintly suggested the brutalities Hitler was himself exerting on German minorities within his own borders. Yet these were the elements which his propagandists stressed and which readied the nation for another war.

With all this, Hitler could not have made Germany march without another factor which underlay the whole German structure. This was a still deeply seated tradition and sense of superiority fostered by Germany's military

philosophers and supported generally by the people. It arose from pride in Germany's many and important military successes in the past and a conviction of superiority which was never entirely dissipated by its really thorough defeat in 1918. The unconvincing character of that defeat in German minds, and the humiliations which defeat brought Germany, supplied the chief nourishment on which Hitler's propaganda could and did thrive.

Germany had no justifiable military, political or economic cause for war and it was always within its power to avert it; but the Allied Powers made the way easy for Hitler's ambitions, first, by their failure to enforce collectively the provisions of the treaty and the agreements made subsequent to the treaty, and, second, by their refusal to take united and timely action in the way of economic concessions which would have strengthened the republic. These concessions, which were never forthcoming in unified form, were belatedly urged on Hitler when they were of no further avail as a war preventive.

In condemning the shortsightedness and indecision of the Allied Powers, it must always be borne in mind that these factors did not cause the war. They only failed to prevent it.

The utter wantonness of Hitler and the willingness of the German people to support him and condone his depredations caused the European war, and in the disappointment caused by the weakness and indecision of the Allied leaders and peoples one could not lose sight of the primary and tundamental responsibility of Germany, Japan and Italy for the years of misery they inflicted on the world.

Futility of Disarmament.-Throughout the period between the two world wars, the western democracies clung persistently to the concept that disarmament in itself would bring peace. Indeed, this became almost the only continuing element of their policy. Even in the face of the most significant acts of aggression on the part of Germany, Japan and Italy, the disarmament conferences went on. No disarmament agreements of any substance were concluded by the axis powers, a fact significant enough in itself; but all the while they went on arming. The democratic governments were informed of this rearmament, but they chose to ignore it. They fastened only the more firmly to the hope that the more convenient policy of disarmament would induce peace. Though no agreements were consummated, the two greatest of the democracies were actually disarming through their failure to maintain their military establishments at any stage which either Germany or the smaller nations, eventually to become Germany's victims, could recognize as a factor measurable in terms of time and effect in enforcing peace.

This tendency arose in large part from the expressions of great bodies of well-meaning people, in both Great Britain and the United States, who firmly believed that no arms meant no violence. It was combined with the ever-present reluctance of political parties in power to take the responsibility of imposing on the electorate the added tax and personal burdens which armament involves.

Whatever the motive, the result was clear. None of the axis powers felt that there was either a will or a capacity to enforce the peace on the part of the great democracies. This belief was transmitted to those countries which might have resisted the aggressions. It thus entered into the calculations of both aggressor and victim—the aggressor being convinced that he could make away with his gains before any retribution could overtake him and the victim being

convinced that resistance was useless, since no help could or would arrive before he was overrun.

Locarno and London.—Two occurrences, rather characteristic of the trend of world politics in the period before 1937, should be referred to before reciting the sequence of the direct and immediate events which led up to the actual outbreak of war. The first was the repudiation of the Locarno pact of 1925, and the second was the failure of the World Economic conference in 1933. During the period between the wars, as indeed in most periods of history, political and economic issues went hand in hand as parallel irritants to friendly relations. In the period referred to, the economic crazy quilt of high tariffs, reparations, foreign loans and strangulation of international trade constantly created international complications and demanded rectification.

A serious effort was made, and for a time seemed successful, to deal with the political issues at Locarno. The conclusion of the pacts ushered in a period of much good feeling. It followed the evacuation of the Ruhr and the acceptance of the Dawes plan as a settlement of the reparations problem and the stability of German economy. At Locarno, Franco-German and Belgian-German boundaries were guaranteed; the permanent demilitarization of the Rhineland was provided for; war was renounced and the principle of arbitration of disputes between the countries was established, except for cases in which self-defense, League action or German violation of the demilitarization provisions was involved. Great Britain and Italy joined in to promise assistance to the country which became the victim of another's aggression. Germany was elected to the League. Thus, all but Germany's eastern boundaries were dealt with. The Soviet Union naturally was disturbed, but in spite of Russian suspicions the Locarno pact established a basis upon which much might be built and even more hoped for. Here was an agreement entered into freely by Germany as a co-equal. It had none of the aspects of the Diktat which Germany signed in the Hall of Mirrors at Versailles.

Hitler came to power in Jan. 1933; in 1936, not long after he had proclaimed his firm intention to observe the agreements which were made at Locarno, hardly more than ten years after the pacts had been signed, the new German leader marched his troops into the Rhineland in direct violation of the pacts. The great powers did no more than make formal protestations to this action.

The other significant event was the attempt made to solve the major economic problems then plaguing the world. To accomplish this, a great economic conference was called together to meet in London in June 1933. The conference was called by the League in a supreme effort to recognize the integral character of the world's economy. The economic dislocations brought on by World War I, and the continued nationalistic measures and countermeasures which were everywhere in force, were patently interfering with the political stability of the world. The conference was to deal primarily with the removal of trade barriers, the stabilization of currencies and disposal of other restrictions impeding world trade.

Though having high hopes and possibilities, the conference at the very outset was spiked by the action of the United States in opposing any measure leading to the stabilization of currencies. Other restrictions on the power of the U.S. delegates, together with the force and manner in which their authority respecting currencies was taken from them by their own chief, turned the conference into something of a fiasco.

The political value of Locarno was destroyed by the

determination of Hitler to prepare his way for outright aggression, whereas the attempt to deal with world economic problems was nullified at a critical time largely by a leader who had just come on the scene and who was top play such a vital part in the final overthrow of Hitler—Pres. Franklin D. Roosevelt. The president felt a compelling domestic need for higher prices and was prepared to place that consideration above the international need for stabilized world economic conditions. This event is stressed as a significant incident of the general trend of nationalistic action which tended to interfere with constructive plans for world peace. The event is the more sig-

nificant in that President Roosevelt, who was later to become almost the personification of collective action and internationalism, was impelled to pursue this course. Whatever his motives, the failure of the London conference served to encourage the policies of economic nationalism. This encouragement unfortunately played into the hands of the nazi leaders of Germany. Other factors may have obstructed the possibilities of success at London, but the action of the United States made a spectacular contribution to its failure.

In the rather long array of incidents and issues marking the opportunities and patterns of the Armistice years

between the great wars, these two events stood out as typical of the halting and contradictory character of Allied action as against the unequivocal evidence of axis intention, particularly as such intention became manifest after Hitler's accession to power. They were only typical, however, for it would not be difficult to find similar instances of the operation of British, French and Russian self-interest or to locate as flagrant an example of axis provocation.

Failure to Check Aggression.—Thus, first one country and then another, the western democracies as well as the U.S.S.R. (for the record shows that all were sooner or later involved) took, or failed to take, action, which set the stage for the ever-present and unrelenting determination of Hitler to divide and conquer. This was the pattern which led to war, and one step after another followed, no one of which seemed sufficient at the time to induce the powers to undertake collective action or even courageous individual action. Some of the major incidents can be only briefly summarized, with consequent risk of oversimplification, but it is impossible to misinterpret the trend.

The Japanese aggression in Manchuria in 1931 apparently was the first of the definite steps toward doom. It is necessary at this stage to look at the state of affairs in the far east to judge the part Japan was to play in the drama.

Paralleling the nazi and fascist motives of Germany and Italy, another virulent and demoralizing force was steadily at work and steadily antagonistic to peace. Comparatively late in emerging from a deep tribal isolationism to become a member of the international community and permeated with a strong militaristic tradition, Japan had persistently expanded its territories and areas of influence through opportunistic conquests before World War I; viz., China (1894), Russia (1904) and the German possessions in the far east (1914).

For a time, after obtaining the concessions for which it contended at Versailles, Japan gave evidence of participating with considerable good will in the international field. It had benefited greatly both territorially and otherwise by its intervention in World War I, at relatively little cost. Encouraged in addition by the spectacle of the weak support given by the great powers to the League and inspired by the opportunities it felt that a feeble China afforded it, Japan's materialist and militarist elements soon impelled the country to discard all inhibitions, seize Manchuria and subjugate Asia to exclusive Japanese interests. When the League rather feebly sought to remonstrate, Japan departed from that organization in a great huff and from then on matched each self-serving protestation of peaceful intent with an act of the most barefaced aggression.

Its first step was, as has been indicated, in Manchuria. In Sept. 1931 a portion of the track of the South Manchurian railway was blown up with all the marks of a manufactured incident. The Japanese army immediately took possession of important strategic positions in Manchuria. Four months later Japanese forces landed in Shanghai, bombarding the town and engaging the Chinese forces located there. All of Manchuria was occupied. The foresighted warning of Henry L. Stimson, then United States secretary of state, who called for collective action, appealed neither to Great Britain, whose stake in the Pacific areas was, if anything, greater than that of the United States, nor to the United States. In spite of Secretary Stimson's prescience, the United States, as Great

Britain well knew, was in no mood to take determined action. In retrospect, the failure to act in Manchuria became the first recognized signpost along the road of missed opportunities, which led to war.

Ethiopia, The Rhineland, Spain.—The League was bluntly challenged by Japan and promptly collapsed before the challenge. It was only a relatively, short time later, in Oct. 1935, that Benito Mussolini defied the League in his brazen conquest of Ethiopia. France this time failed to support Great Britain, and it was not long before the shoe was on the other foot when in March 1936 Hitler marched into the Rhineland. As Pierre Laval had failed to support Great Britain over Ethiopia, so now Stanley Baldwin failed to join with France over the Rhineland, and again there was no firm individual or collective action.

These were portentous incidents, but more ominous than any of them was the outbreak of bitter armed conflict within Europe itself. The Spanish peninsula, so important to British and French interests, became in July 1936 the scene of a violent struggle which ended in a serious deterioration of British and French power in Europe. The civil war moved from a left-versus-right domestic struggle to a sort of international proving match of strength and weapons, in which German and Italian forces became deeply involved; and the position of the democratic powers became increasingly weak as totalitarian forces were strengthened. "Nonintervention" became a watchword of Allied policy, and still the German and Italian reinforcements of men and arms grew. Russian aid was given to the loyalists (left) but never on the scale of the axis assistance which was made available to Gen. Francisco Franco's rightist forces. Entire divisions were transported to the peninsula, and the fighting was on a fully organized scale. The war in Europe had in reality already started, but it was significantly obscured in western eyes by a fog of ideologies-communism versus the right and a stubborn refusal to face up to political and strategic realities. Refuge was taken in nonintervention pacts entered into after laborious exchanges between foreign offices but only unilaterally observed. When the fog had lifted with a Franco victory, English sea power all over the world was compromised by the weakened position of its fleet in the Mediterranean. France had another hostile European power with which to cope. The Soviet Union was more deeply isolated, and Hitler was better heeled for his impending excursions into middle Europe.

Japan again renewed its aggression by the seizure of Peiping in July 1937. Italy withdrew from the League. Through all this period the greatest potential power for peace had little to offer. The United States at this stage appeared to the world as isolationist, pacifist, neutral, disarmed, and its government had little influence upon the world situation. Others were to call the tune by which the world was to dance, and the attitude of the United States was ignored by the aggressor nations who were in a few years to be destroyed by a combination of powers of which the United States was to be the chief centre of strength.

Austria and Czechoslovakia.—While Hitler was already fighting in Spain, he was preparing at home his more ambitious plans of conquest and forging the means by which they were to be carried out.

By 1936 the paramilitary organizations of Germany were in full strength. The Sturm Abteilungen (SA), the Schutzstaffel (SS) and the Reichsarbeitsdienst (RAD) consisted of more than 1,500,000 men disciplined as military organizations, yet intimately involved in the social

and political life of the country. They were the select exponents of the nazi doctrine. Force was the keystone of their existence. Their intermittent spectacles of massed manpower with Teuton, if not barbaric, display of colour and music gave indication of the dangerous momentum of the country. At their head was the coterie of individuals which had followed Hitler to power. Strange mixtures of zealots and opportunists placed in positions of great and self-perpetuating authority, they came to feel no limit to their ambitions or the destiny of the state they ruled. Though Hitler seems to have had a design for all his conquests, the tremendous concentration of power in the hands of this relatively small group created a psychological impulse as well as a means to act promptly and drastically. With this fearful imperative it was not long before final action was forthcoming.

Austria was marked as the first victim. Chancellor Engelbert Dollfuss had made an attempt at strengthening the government in Austria in 1933 but it was not the type of strength which Hitler sought, since it involved exclusion of nazis. After Dollfuss' assassination in 1934 by nazi storm troopers, Kurt von Schuschnigg became chancellor and under heavy external pressure in July 1936, agreed to a friendship agreement with Germany.

Not content with this arrangement and in accordance with plans laid far in advance, Hitler, with a modern modification of Canossa, first humiliated Schuschnigg at his Berchtesgaden hilltop and then forced Schuschnigg's resignation. This time full collaboration with the nazis was exacted, and on the night of March 11, 1938, German troops in their new war paint marched into Austria on the pretense that Chancellor Arthur Seyss-Inquart, the new nazi chancellor, needed them to restore order.

Next in order was Czechoslovakia; nazi propaganda began its heaviest drumfire on this front in the summer of 1938. The world heard much during this period about Hitler's rages and his "patience." So great was the instinct for appeasement, so firm the determination not to be embroiled over issues in "remote" countries, that the appeal of President Eduard Beneš for assistance brought only a blunt proposal by the French minister at Prague that unless Czechoslovakia agreed to the Anglo-French plan for the surrender of the Sudetenland to Germany with the abandonment of the highly prized border fortifications and its existing military alliance, Czechoslovakia could look elsewhere for help. It was quite clear that if Czechoslovakia refused, it had to face the rearmed might of Germany alone.

Munich.—Somewhere between Sept. 21 and Oct. 1, 1938, another opportunity for France, Britain and the U.S.S.R. to join and oppose was lost. The famous Munich agreement, from which the soviet union was excluded, was entered into on Sept. 30 and incorporated a drastic concession to Germany in the Sudeten issue. It was such an abandonment of Czechoslovakia that it represented a showdown on the one hand too humiliating for the great powers long to endure and on the other, too successful for nazi politics not to exploit. Again great pressure was placed on the Czech government to conform to the Munich agreements, and just at this stage even Poland, soon itself to be engulfed, sped an ultimatum to demand the immediate cession to it of the Teschen area. Again came capitulation, and this time President Beneš resigned and fled to London. Neville Chamberlain, Edouard Daladier and the Munich capitulation were much criticized. But individuals were condemned for a policy which was largely dictated by the people of the Allied nations themselves. Munich was generally applauded in France and Britain, and the representatives of those countries were met with welcoming crowds on their return. Prime Minister Chamberlain was following the overwhelming desire of the people of Great Britain to avoid a war which they sensed would be desperate if not worse in its consequences to them. Subconsciously, they sensed the significance of air power as not only a challenge to their long dominance of the seas but as a weapon which could be employed perhaps disastrously against the homeland itself. The people of France were in a like mood. Czechoslovakia was not in the sphere of their vital interests. It was probably time, they reasoned, that such a maladjustment as the Sudetenland should be moderated. "If we have to fight it must be on larger issues than that," said Chamberlain, echoing the sentiments of the majority when he said it. A "quarrel in a far away country between people of whom we know nothing" was not a sufficient base on which to make a stand. But if Chamberlain was doing all he could to avoid a stand which might mean war, he was merely coping with a dilemma which Stanley Baldwin had had more timely opportunity to avoid. Daladier was but following a course toward which Camille Chautemps and the rationalizing spirit of France had directed him.

The illusion of "peace in our time" which it was hoped that truce had brought was soon to be dispelled. On the night of March 14, 1939, Pres. Emil Hácha of Czechoslovakia was called to Berlin, subjected to another of Hitler's set tirades and threatened with the destruction of Prague by air. In the face of these threats, and in something like six months after Munich, all Czechoslovakia was overnight made a vassal state of Germany.

Poland and the Russo-German Pact.—Great Britain and France were belatedly aroused, if not to collective European action, at least to strong joint and individual action. Poland was so obviously the next victim that this time Great Britain made its position entirely clear in advance. An attack on Polish independence resisted by the Poles, would mean active support to Poland from Great Britain, and in this action it was stated that France would join. At this point Mussolini attacked and on April 8, 1939, seized the weakest opponent at hand—Albania.

Events moved quickly. A firm military alliance was concluded between Germany and Italy on May 9, 1939. Maxim Litvinov, soviet commissar for foreign affairs, who had been an outspoken and consistent advocate of collective security, resigned on May 3, 1939, an ominous note if one had the foresight to interpret it, for shortly thereafter and almost in the midst of protracted Allied-Soviet negotiations for collective action in the event of further German aggression, Moscow announced on Aug. 21, 1939, a ten-year treaty of nonaggression and neutrality with nazi Germany. Left out of the Austrian settlement and the Munich negotiations, suspicious of the western powers and desirous of a free hand in the Baltic states, soviet Russia joined hands with Germany on the verge of battle. Its motives were destined to be debated and its conduct alternately supported and condemned at least until the time, if ever, when history might disclose definitive proof of their true character.

The great hope of Russia from the time of the treaty of Brest-Litovsk had lain in the spread of great revolutionary movements. It was Nicolai Lenin's thought that his action in withdrawing as a participant from World War I would be followed by revolutionary developments in Germany and the German army. Subsequently, it became a tenet of the soviet faith that such movements must oc-

cur throughout the world if the full concept of soviet philosophy were to develop. In the interval between the two world wars such upheavals were not forthcoming to the degree soviet concepts required. The soviet leaders set about implanting agents and propagating soviet doctrine in the countries and dependencies of the western democracies. This doctrine of revolution, mixed with some rather involved interpretations of its own self-interest, constantly ran counter to the soviet need for collective action to meet the recrudescence of German strength. There was inculcated in its people the fear of the "imperialism" of the western democracies which rather outdid in rivalry, as the chief enemy concept, the strength of fascism or the growth of German industrial and military power. If the western European powers had been very slow to recognize the need for a soviet rapproachement, their reluctance could be understood when all the while soviet agents fomented destruction of their governments.

If Litvinov, a liberal diplomat of wide experience, did see the need and worked toward collective action, there were others in the soviet union who inspired actions which gave the democracies as much cause for suspicion as the exclusion of soviet representatives from important councils gave the soviet union.

Another strong element in Allied suspicions was the constantly recurring suggestion of soviet desire for continuing "imperialistic" wars. Indeed, until Hitler made it so unmistakably clear that the object of his chief animosity was the soviet union, Joseph Stalin seemed not to fear the nazi development in Germany. With this background it was not surprising that both British and Russian leaders should harbour the unexpressed hope that matters would so fall out that their respective countries could stand aloof while Germany became embroiled in war with the other.

After many unfortunate failures to co-operate in the solution of European problems, this conflict was put to the final test. The soviet union held out for guarantees which Britain did not feel it could give. Not receiving the price of its support, it spectacularly stood aside to permit Germany to have its way with Poland. Germany was not long in acting, and the failure of any combined Anglo-French-Russian policy to check the aggressor was to cost the soviet union unbelievable destruction and death, France utter defeat and bring England and the whole civilized world to the brink of ruin.

Hitler, with his border problems now in order, struck at Poland on Sept. 1, 1939. Great Britain and France, no longer hesitant, declared war on Germany two days after the attack; but no steps could be taken to save Poland from its fate. (See under section VI below, p. 763, for a discussion of the general trends of World War II.)

(J. J. McC.)

THE WAR IN EUROPE, AFRICA AND THE NEAR EAST A. The German Campaign in Poland

The German conquest of Poland in Sept. 1939 was the first demonstration in war of the theory of high-speed armoured warfare which had been conceived by the British tank exponents after World War I and adopted by the Germans when their rearmament began. Although the senior German generals took a cautious view of the new technique and had developed the means for it in a measure much more limited than the tank exponents visualized, it sufficed to produce a startlingly quick victory. Poland was all too well suited for such a demonstration. Its frontiers

were immensely wide—about 3,500 mi. in all. The stretch of 1,250 mi. adjoining German territory had recently been extended to 1,750 mi. by the occupation of Czechoslovakia. This had also resulted in Poland's southern flank's becoming exposed to invasion as the north flank, facing East Prussia, already was. Western Poland had become a huge salient that projected between Germany's jaws.

1. Polish Dispositions.—It would have been wiser for the Polish army to assemble farther back, behind the broad river lines of the Vistula and the San, but that would have entailed the definite abandonment of some of the most valuable parts of the country. The Silesian coal fields were close to the frontier, while most of the main industrial zone, though farther back, lay west of the river barrier. It was difficult to conceive that the Poles could have maintained their hold on the forward areas even in the most favourable circumstances, but the economic argument for making the attempt, and delaying the German approach to the main industrial zone, was heavily reinforced by national pride and military overconfidence, as well as by an exaggerated idea of what Poland's western allies could do to relieve the pressure.

The Polish army at peace strength was as large as the French and not much smaller than the German. It comprised 30 infantry divisions and 12 cavalry brigades. But Poland's industry was insufficient to make full use of its manpower or even furnish an adequate scale of equipment for its active forces. On mobilization it could increase its number of divisions by only a third, whereas Germany could more than double its divisions, except for the armoured and motorized ones; but this limitation on Germany's side was offset by Poland's almost complete lack of such modern type forces. Poland had no armoured or

German mechanized unit rolling through a Polish town battered by luftwaffe raids during the opening weeks of World War II

motorized divisions—merely a sprinkling of light tanks, while only one of its cavalry brigades was motorized; and its old-style formations were very short of both anti-tank and anti-aircraft guns. Yet many of its leaders gallantly but absurdly clung to the double belief that their preponderance of horsed cavalry was an important asset and that they could take the offensive against the German mechanized forces. They also tended to discount the effect of Germany's vastly superior air force, which was nearly ten times as powerful as their own.

The unrealism of such an attitude was repeated in the Polish dispositions. Approximately a third of the forces were concentrated in or near the Corridor (Polish Pomorze), where they were perilously exposed to a double envelopment-from East Prussia and the west combined. This indulgence of national pride was inevitably at the expense of the forces available to cover the areas more vital to Poland's defense. For in the south, facing the main avenues of approach, the forces were thinly spread. At the same time nearly another third of Poland's forces were massed in reserve north of the central axis, between Lodz and Warsaw, under the commander in chief, Marshal Edward Smigly-Rydz. This grouping embodied the offensive spirit; but its aim of intervening with a counterattack did not correspond to the Polish army's limited capacity for manoeuvre, even if this had not been cramped by German air attack on the rail and road routes of movement. The Poles' forward concentration in general forfeited their chance of fighting a series of delaying actions, since their foot-marching army was unable to get back to the positions in the rear, and man them, before being overrun by the invader's mechanized columns. In the wide spaces of Poland the unmechanized state of its forces was a heavier handicap than the fact that it was caught by surprise before all its reserves had been called up. By the same token, the 40-odd infantry divisions of normal pattern which the Germans employed in the invasion counted for much less than their 14 mechanized or partially mechanized divisions. These included six armoured divisions, four light divisions (motorized infantry with two armoured units) and four motorized divisions. It was their deep and rapid thrusts that decided the issue, in conjunction with the overhead pressure of the luftwaffe which wrecked the Polish railway system, besides destroying most of the Polish air force before it could come into action.

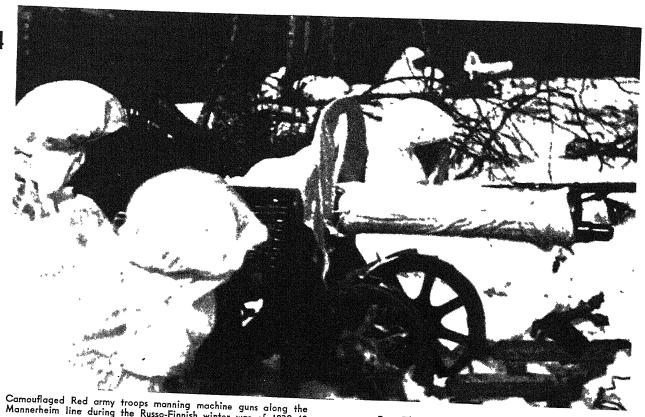

2. The German Offensive.—The German forces crossed the frontier shortly before 6 A.M. on Sept 1, 1939; air attacks had begun an hour earlier. In the north, the invasion was carried out by Gen. (later Field Marshal) Fedor von Bock's army group, which comprised the 3rd army under Gen. (later Field Marshal) Georg von Keuchler, and the 4th army under Gen. (later Field Marshal) Guenther von Kluge. The former thrust southward from its flanking position in East Prussia, while the latter pushed eastward across the Polish Pomorze to join it in enveloping the Poles' right flank. The greater role was given to Gen. (later Field Marshal) Karl Rudolf Gerd von Rundstedt's army group in the south. This was nearly twice as strong in infantry, and more in armour. It comprised the 8th army under Gen. (later Field Marshal) Johannes von Blaskowitz, the 10th under Gen. (later Field Marshal) Walter von Reichenau and the 14th under Gen. (later Field Marshal) Siegmund List. Blaskowitz, on the left wing, was to push toward the great manufacturing centre of Lodz and help to isolate the Polish forces in the Poznan salient, while covering Reichenau's flank. On the right wing, List was to push for Cracow and simultaneously turn the Poles' Carpathian flank, using an armoured corps to drive through the mountain passes. The decisive stroke, however, was to be delivered by Reichenau, in the centre; and for that purpose he was given the bulk of the armoured forces.

The success of the invasion was helped by the way that the Polish leaders, despising the defensive, had devoted little effort to the construction of defenses, preferring to rely on counterattacks-which they believed their army, despite its lack of machines, could effectively execute. Thus, the mechanized invaders had little difficulty in finding and penetrating open avenues of advance, while most of the Polish counterattacks broke down under the combined effect of a repulse to their forward movement and a deepening German threat to their own rear. By Sept. 3, when Britain and France entered the war, Kluge's advance had cut the Corridor and reached the lower Vistula, while Keuchler's pressure from East Prussia toward the Narew was developing. What was more important, Reichenau's armoured forces had penetrated to the Warta and forced the crossings there. Meanwhile, List's army was converging from both flanks on Cracow, forcing Gen. Antoni Szylling's army in that sector to abandon the city and fall back to the line of the Nida and the Dunajec.

By Sept. 4 Reichenau's spearheads had reached and crossed the Pilica, 50 mi. beyond the frontier. Two days later his left wing was well in the rear of Lodz, after capturing Tomaszow, and his right wing had driven into Kielce. Thus, the Polish Gen. Juliusz Rommel's army, covering the Lodz sector, was outflanked, while Gen. Stanislaw Kutrzeba's army was still far forward near Poznañ, and in danger of being isolated. The other German armies had all made progress in fulfilling their part in the great enveloping manoeuvre planned by Gen. Franz Halder, the chief of the general staff, and directed by Gen. (later Field Marshal) Walther von Brauchitsch, the commander in chief. The Polish armies were splitting up into unco-ordinated fractions, some of which were retreating while others were delivering disjointed attacks on the . nearest German columns.

The German advance might have travelled still faster but for a lingering conventional tendency to check the mobile forces from driving far ahead of the infantry masses that were backing them up. But as newly gained experience showed that such a risk was offset by the opponents' confusion, a bolder course was pursued. Exploiting an open gap between Lodz and the Pilica, one of Reichenau's armoured corps raced through to the outskirts of Warsaw on Sept. 8; it had covered 140 mi. in the first week. By the following day the light divisions on his right wing reached the Vistula farther south, between Warsaw and Sandomierz. They then turned northward. Meanwhile, near the Carpathians, List's mobile forces had swept across the Dunajec, Biala, Wisloka and Wislok in turn, to the San on either flank of the famous fortress of Przemysl. In the north, Keuchler's army had pushed across the Narew and was attacking the line of the Bug, in the rear of Warsaw. Thus, a wider pincer movement was strongly developing outside the inner pincers that were closing on the Polish forces in the bend of the Vistula west of Warsaw.

On Sept. 10 Marshal Smigly-Rydz issued orders for a general retreat into southeastern Poland, where Gen. Kazimierz Sosnkowski was placed in charge, with the idea of organizing a defensive position on a relatively narrow front for prolonged resistance. But this was now a vain hope. While the big encirclement west of the Vistula was being tightened, the Germans were now penetrating deeply into the area east of the Vistula. Moreover, they had

Camouflaged Red army troops manning machine guns along the Mannerheim line during the Russo-Finnish winter war of 1939—40

turned both the line of the Bug in the north and the line of the San in the south. On Keuchler's front, an armoured corps drove southward in a wide outflanking thrust to Brzesc-nad-Bugiem (Brest-Litovsk). On List's front, Gen. (later Field Marshal) Paul von Kleist's armoured corps reached the city of Lwow on Sept. 12. There the Germans were checked by Sosnkowski, but they spread northward to meet Keuchler's forces. Although the invading columns were feeling the strain of their deep advances and were running short of fuel, the Polish command system was so badly dislocated that it could not profit either by the Germans' temporary slackening or by the stubbornness that many isolated bodies of Polish troops still showed. These dissipated their energy in random efforts while the Germans were completing the encirclement.

3. The Russian Invasion.—On Sept. 17 the soviet armies crossed Poland's eastern frontier. That blow in the back sealed its fate, for there were scarcely any troops there to oppose this second invasion. Next day the Polish government and high command crossed the Rumanian frontier, the commander in chief sending back a message to tell his troops to fight on. Perhaps it was as well that it did not reach most of them, but many gallantly fulfilled its intention in the days that followed, although their resistance collapsed bit by bit. The garrison of Warsaw held out until Sept. 28, despite heavy bombardment from the air and the ground; and the last considerable Polish fragment did not surrender until Oct. 5, while guerrilla resistance continued into the winter. About 80,000 escaped over neutral frontiers. The German and Russian forces had met and greeted each other, as partners, on a line running south from East Prussia past the Narew-Bug line and Przemysl to the Carpathians. That partnership was sealed, but not cemented, by the mutual partition of Po-

The Russo-Finnish Winter War

Following the partition of Poland, the soviet government made haste to underwrite its forward security policy by re-establishing strategic control of Russia's former buffer territories in the Baltic. By Oct. 10, 1939, Estonia, Latvia and Lithuania were induced to allow soviet forces to garrison key points on their soil. On Oct. 14 similar demands were presented to Finland. Considered from the viewpoint of strategic safeguards-against Hitler's possible use of Finnish territory as a springboard for attack on the U.S.S.R.-they were moderate, and the small cessions of territory required of Finland were to be compensated by the U.S.S.R.'s giving up strips elsewhere. But national sentiment made it hard for the Finns to agree to a settlement on these lines. When they continued to argue the points, the soviet forces invaded their country on Nov. 30.

1. Early Finnish Successes.—The original advance ended in a check that astonished the world. A direct push from Leningrad up the Karelian isthmus came to a halt in the forward layers of the deep and well-fortified Mannerheim line. Á flanking advance north of Lake Ladoga made no better progress. At the other end of the front the Russians cut off the small port of Petsamo on the Arctic ocean, as a means of blocking the entry of help to Finland by that route. Two more immediately menacing thrusts were delivered across the waist of Finland. The more northerly thrust penetrated past Salla to Kemijärvi, halfway to the Gulf of Bothnia, before it was driven back by the counterattack of a Finnish division which had been switched up by rail from the south. The southerly thrust, past Suomussalmi, was interrupted in turn by a counterstroke, early in Jan. 1940. Circling round the invaders' flanks, the Finns blocked their line of supply and retreat, waited until their troops were exhausted by cold and hunger, then attacked and broke them up.

Sympathy with Finland as a fresh victim of aggression had rapidly developed into enthusiasm at the apparent success of the weak in repulsing the strong. This impression had far-reaching repercussions. It prompted the French and British governments to consider the dispatch of an expeditionary force to this new theatre of war with the object, not only of aiding Finland, but of securing the Swedish iron mines at Gallivare from which Germany drew supplies, while establishing themselves in a position that threatened Germany's Baltic flank. Partly because of the objections raised by Norway and Sweden, this project did not materialize before Finland collapsed. France and Britain were thus spared entanglement in war with the U.S.S.R. as well as with Germany-at a time when their own powers of defense were perilously weak. But the obvious threat of an Allied move into Scandinavia precipitated Hitler's decision to forestall it by occupying Norway. Another effect of Finland's early successes was that it reinforced the tendency in western quarters to underrate the soviet military strength. The general view was epitomized in Winston Churchill's broadcast assertion of Jan. 20, 1940, that Finland "had exposed, for the world to see, the military incapacity of the red army." His misjudgment was to some extent shared by Hitlerwith momentous consequences the following year.

More dispassionate examination of the campaign, however, provided better reasons for the ineffectiveness of the original advance. There was no sign of proper preparation to mount a powerful offensive, furnished with large stocks of munitions and equipment. There were clear signs that the soviet authorities had been misled by their sources of information about the situation in Finland, and that, instead of reckoning on serious resistance, they imagined that they might have to do no more than back up a popular rising of the Finnish people against an unpopular government. The country cramped an invader at every turn, being full of natural obstacles that narrowed the avenues of approach and helped the defense. Between Lake Ladoga and the Arctic ocean the frontier appeared very wide on the map but in reality was a tangle of lakes and forests, ideal for laying traps as well as for stubborn resistance. Moreover, on the soviet side of the frontier the rail communications consisted of the solitary line from Leningrad to Murmansk, which in its 800-mi. stretch had only one branch leading to the Finnish frontier. This limitation was reflected in the fact that the "waist-line" thrusts which sounded so formidable in the highly coloured reports from Finland were made with only one division apiece, while only two were employed in the outflanking manoeuvre north of Ladoga.

2. Mannerheim Line Crushed.—Much the best approach to Finland was through the Karelian isthmus, but this was blocked by the Mannerheim line, while the Finns' six active divisions were concentrated there at the outset. The Russian thrusts farther north, though they fared badly, served the purpose of drawing part of the Finnish reserves thither while thorough preparations were being made, and 14 divisions brought up, for a serious attack on the Mannerheim line. This was launched on Feb. 1, under the direction of Gen. Kizil A. Meretskov. Its weight was concentrated on a ten-mile sector near Summa, which was pounded by a tremendous artillery bombardment. As the fortifications were pulverized, tanks and sledge-carried infantry advanced to occupy the ground, while the Russian air force broke up attempted countermoves. After little more than a fortnight of this methodical process a breach was made through the whole depth of the Mannerheim line. The attackers then wheeled outward to corner the Finnish forces on either flank, before pushing on to Viipuri (Viborg). A wider flanking operation was carried out across the frozen Gulf of Finland by troops who advanced from the ice-bound island of Hogland and landed well in the rear of Viipuri. Although an obstinate defense was still maintained for several weeks in front of Viipuri, Finland's limited forces had been worn down in the effort to hold the Karelian isthmus. Once a passage was forced, and their communications menaced, eventual collapse was certain. Capitulation was the only way in which it could be averted, since the proffered Anglo-French expeditionary force had not arrived, though almost ready to sail. Field Marshal Carl Gustav Emil von Mannerheim, the Finnish commander in chief, had been too optimistic in estimating that Finland could hold out with its own resources until after the spring thaw. On March 6, 1940, the Finnish government sent a delegation to negotiate peace, and on March 13 it was announced that the soviet terms had been accepted. They were not much more severe than those proposed in the first place.

C. German Campaigns in Denmark, Norway

As the Nuernberg trials later brought out, the German conquest of Norway and Denmark was the first of Hitler's aggressions which was not long premeditated. He was led into it unwillingly by the combined effect of persuasion from some of his followers and provocation from his opponents' moves. The persuasion started from the arguments of Vidkun Quisling, the Norwegian pronazi, about the possibility of the British occupying the Norwegian coast, with or without the consent of the Norwegian government. It was reinforced by Adm. Erich Raeder who, in Oct. 1939, pointed out both the danger of such a development and the advantage to Germany of occupying that coast to loosen the grip of the British blockade. Further incitement came from British and French talk of various moves to rally the neutrals to their side and threaten Germany's flanks. This possibility was increased by Allied offers of aid to Finland.

As late as Dec. 18, 1939, Hitler-in private discussions with the advocates of the Norwegian project-emphasized that he would prefer that Norway, as well as the rest of Scandinavia, remain completely neutral; he did not intend to enlarge the theatres of war and draw other nations into the conflict-unless "the enemy took such steps with the aim of further throttling and threatening Germany." But in Jan. 1940 Winston Churchill, in a broadcast, addressed the neutrals on their duty to join in the fight against Hitler, while other signs of an Allied move multiplied. Toward the end of the month Hitler approved a preparatory study of the problem of seizing the Norwegian ports. Then on Feb. 18, 1940, the British destroyer "Cossack," on orders from the admiralty, pushed up Josing fjord and forcibly rescued naval prisoners from the "Altmark," a German vessel which had taken refuge there. This action infuriated Hitler and was the spark that ignited the powder trail. On Feb. 21 he appointed Gen. Nikolaus von Falkenhorst to prepare the forces for an invasion of Norway, and of Denmark too, as a necessary strategic steppingstone. On April 2 he gave the order for the invasion to be launched a week later.

When the Germans later captured the French archives they found reason for self-justification and self-congratulation in the evidence of how narrowly they had forestalled the Allies. These documents showed that from Jan. 1940 onward the latter had been discussing plans for extending the expedition to help Finland, which they were preparing, into "the seizure of ports and aerodromes on the west

coast of Norway," and the further step of "occupying the iron ore mines at Gallivare," in the north of Sweden. On Feb. 21 the French prime minister, Edouard Daladier, urged that the "Altmark" incident should be used as a ground for the immediate seizure of the Norwegian ports. This initiative was regarded with some doubt in London, as the forces were not ready and Neville Chamberlain still hoped that the Scandinavian governments would agree to the entry of Allied troops. At a meeting on March 11, however, Churchill unfolded a scheme of arriving in force off Narvik and throwing a detachment ashore immediately, on the principle of "displaying a strength in order to avoid having to use it." These projects were temporarily upset by Finland's capitulation on March 13, but a fortnight later it was agreed that fresh pressure should be applied to the governments of Norway and Sweden. A mine-laying operation in Norwegian waters was to be carried out on April 5, and the first convoy of troops was to sail for Narvik three days later.

1. German Invasion.-These dreams were abruptly dispelled. The mine laying did not take place until April 8. In the dark hours of the following morning small detachments of German troops, carried mostly in warships, arrived in or near the chief ports of Norway, from Oslo right up to Narvik, and captured them with little difficulty. Their commanders announced to the local authorities that they had come to take Norway under German protection against an Allied invasion that was imminent. A similar announcement had been made by the German minister in Oslo when, just after 4 A.M., he paid a sudden call on the Norwegian foreign minister; and the same was done in Denmark at the same hour. The total force that executed this string of coups was very limited. It comprised 7 cruisers, 14 destroyers, a number of auxiliary craft and the leading elements of 6 divisions-amounting altogether to about 10,000 troops. One parachute battalion was also employed, the first time that parachute troops had been used in war. While they made an important contribution to the German success, the most decisive factor, as in Poland, was the luftwaffe. It overawed the Norwegian people in the first phase and later paralyzed the Allies' countermeasures.

The most astonishing of the opening series of coups was that at Narvik, for this far northern port was about 1,200 mi. distant from the German naval bases. On the evening of April 8 the Norwegian naval authorities were notified by the British admiralty that a number of German warships appeared to be making for Narvik. One of the two Norwegian coast-defense ships went out to the mouth of the fjord as a precaution but was quickly sunk by the attacking force, which comprised six of Germany's latest destroyers. The other Norwegian warship met them on their arrival in the harbour and scored some damaging hits before it was sunk. But the shore defenses made no attempt at resistance; the local commander was a close friend of Quisling. Next day a British destroyer flotilla steamed up the fjord and fought a mutually damaging action with the Germans, and then on April 13 these were finished off by the inroad of a stronger flotilla supported by the battleship "Warspite." But the opportunity for a landing was not exploited and the German troops were allowed time to establish themselves firmly in and around Narvik.

Farther south, Trondhjem was captured with ease after the German ships had run the gauntlet of the batteries dominating the fjord—a hazard that had dismayed Allied experts who had considered the problem. By securing

Trondhjem, the Germans had possessed themselves of the strategic key to central Norway, though the question remained whether their handful of troops there could be reinforced from the south. At Bergen, Stavanger and Kristiansand the Germans suffered some damage from the Norwegian warships and batteries but had little trouble once they were ashore. They also landed small detachments at Arendal and Egersund on the south coast. In the approach to Oslo, however, the main invading force suffered a jolt. For the large cruiser "Bluecher," carrying many of the military staff, was sunk by torpedoes from the Oscarsborg fortress, and the attempt to force the passage was then given up until this fortress surrendered in the afternoon, after heavy air attack. Thus, the capture of Norway's capital devolved on the troops who had landed on the Fornebu airfield; in the afternoon this token force staged a parade march into the city, and their bluff succeeded. But the delay at least enabled the king and the government to escape northward with a view to rallying

The capture of Copenhagen was timed to coincide with the intended arrival at Oslo. The Danish capital was easy of access from the sea, and shortly before 5 A.M. three small transports steamed into the harbour, covered by aircraft overhead. The Germans met no resistance on landing and a battalion marched off to take the barracks by surprise. At the same time Denmark's land frontier in Jutland was invaded, but after a brief exchange of fire resistance was abandoned. The occupation of Denmark went far to ensure the Germans' control of a sheltered sea corridor from their own ports to southern Norway and also gave them advanced airfields from which they could support the troops there. While the Danes might have fought longer, their country was so vulnerable as to be hardly defensible against a powerful attack with modern weapons.

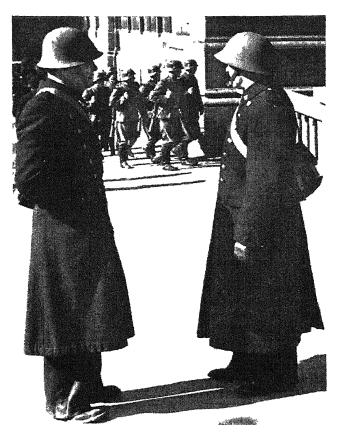

Norway should have been a much tougher problem. But at all points the invaders' path was eased because, despite the warnings from the Norwegian minister in Berlin and urgings from the chief of the general staff, no order for mobilization was given until the fateful night of April 8-9. The Allies were also caught napping. Although for three months they were busy with schemes for establishing themselves in Scandinavia, and thus threatening Germany's flank, they failed to make adequate preparations and have suitable forces ready for a prompt counter to a German invasion. Speaking in the house of commons on April 11, Winston Churchill, then first lord of the admiralty, dwelt on Hitler's "grave strategic error" and declared: "I feel we are greatly advantaged by what has occurred, provided we act with increasing and increasing vigour to turn to the utmost profit the strategic blunder into which our mortal foe has been provoked." The final word was of historical significance. But it was soon made clear that such "vigour" did not mean a willingness to venture into the Skaggerak and Kattegat with surface warships in an effort to interrupt the flow of German reinforcements to Norway. Fear of German air attack forbade it. Caution also prevailed to cancel an attempt to force an entry into the Trondhjem fjord and eject the Germans from that key point before it was too late.

2. Allied Landings in Norway.—The land effort was even more feeble. It was not until April 12 that the first convoy of the force under Gen. P. J. Mackesy which had been allotted for Narvik originally, before the German invasion, sailed from the Clyde. It comprised only two infantry brigades, and on the way to Narvik one of these, the 146th, was diverted to Namsos. This was the result of a new plan for a further expedition, under Gen. Sir Adrian

Carton de Wiart, to regain Trondhjem. Before the direct attack, the 146th was to be landed north of it, at Namsos, together with a further brigade. But then the plan was changed, and the latter was sent to land at Andalsnes, south of Trondhjem, the idea being that the two thrusts would act as diversions to cloak and assist the attack on Trondhjem. These landings began on April 16 and 18, respectively, after naval detachments had earlier occupied the harbours. Both were made without loss. Then the plan was changed again. It was decided to exploit these footholds for a pincer move against Trondhjem and thus avoid the risks of forcing a passage into the Trondhjem fjord. The landing at Namsos was reinforced by a demibrigade of French chasseurs alpins, also diverted from Narvik; and a second British brigade was sent to Andalsnes. Gen. Sir Bernard Paget was sent to handle the latter pincer while Gen. Carton de Wiart was left in charge of the former, and Lieut. Gen. H. R. S. Massy was to command the whole.

On paper the chances looked good, for there were less than 2,000 German troops in the Trondhjem area, whereas the Allies had 13,000. The advance south from Namsos, however, was clogged by the deep snow and then upset by the threat to its rear produced by the landing of several small German detachments near the top of the Trondhjem fjord, supported by the one destroyer which the Germans had in the area. Carton de Wiart's forces fell back north of Steinkjer and were so harried by air attacks that on April 23 he suggested their evacuation. The advance from Andalsnes reached Dombas in the Gudbrand valley on April 19 but instead of being able to wheel north on Trondhjem, it quickly turned into a defense of its own communications against the German troops who were pushing up the valley from Oslo and brushing back the Norwegians. From Dombas the 148th brigade was sent down the valley to support the Norwegians at Lillehammer but was soon driven back on the 15th brigade, which had taken up a position at Kvam, south of Dombas. On April 25 General Massy reported that the British lodgment in central Norway could be maintained only if sufficient air support was provided to check the luftwaffe, which was severely harassing the valley and the base. As this was not possible, two days later he advised evacuation, and the authorities at home agreed. The decision naturally met with strong protest from the indomitable Norwegian commander in chief, Gen. Otto Ruge, but was justified by a realistic view of the prospect, now that the invaders' strength was growing. After covering the northward retreat of the scattered Norwegians, Paget's force began its withdrawal down the Rom valley to the sea. The re-embarkation at Andalsnes was completed on the night of May 1, and the force at Namsos was evacuated on the following night. The Germans were thus left in complete control of southern and central Norway.

3. Narvik Episode.—The Allies now concentrated on gaining Narvik, more for "face-saving" purposes than from any continued hope of reaching the Swedish iron mines. The original Allied landing in that area had been made on April 14, and the Allied forces were eventually built up to a strength of about 15,000 men (including a French and a Polish brigade), while the Norwegian forces there were on similar scale. But progress was slow. The 2,000 Austrian alpine troops who had been used to seize Narvik had been reinforced by as many sailors from the disabled German destroyers; skilfully handled by Gen. Eduard Dietl, they made the most of the defensive advantages of the difficult country. Heavy snowstorms also delayed both preparations and operations so that Narvik was not wrest-

Nazi troops (background) in Oslo shortly after the occupation of Norway in April 1940. The two unarmed Norwegian policemen in the foreground were helpless onlookers

ed from the Germans until May 28. By this time the German offensive in the west had driven deep into France, and the Allies were now more concerned with saving themselves from decisive defeat there than in saving their faces in Scandinavia. So on June 7 the Allied forces were evacuated from Narvik. The king and the government had left Norway for England, and the Norwegian forces laid down their arms.

D. The Western Front, First Phase

1. The "Phony War."-When the Germans invaded Poland on Sept. 1, 1939, they left only 23 divisions in the west. The French mobilized nearly five times as many divisions. The German generals themselves felt that their western front was dangerously underinsured, but they could see no way of increasing the insurance without forfeiting their chance of a quick victory over Poland. Their anxiety proved excessive. The French had hardly dented the foremost layers of the defense before the Germans had overrun Poland and returned in force to the west. The French advance was confined to the 100-mi. stretch of the common Franco-German frontier between the Rhine and the Luxembourg border, and any pressure was limited to narrow sectors of this stretch. At the end of the month, following the collapse of Poland, the French command decided to withdraw its divisions to the shelter of its own Maginot line. Then stagnation settled on the western front for the next seven months.

The German command felt that the French had never seriously tried to attack and had thereby let slip a great opportunity. The first assumption was true; the second more doubtful. The French army was a ponderous ma-

chine, with a tactical doctrine to match, and thus had little capacity for rapid action. Even if the French army had been fitted for manoeuvre, room for manoeuvre was lacking as long as Belgium remained neutral. On Sept. 1 Gen. Maurice Gustave Gamelin, the French commander in chief, addressed a memorandum to his government which

German frontier sentries on duty along the western front during the winter of 1939–40, the period of the "phony war" which was described in communiques of the day as "the usual inactivity"

argued that the only way of success would lie in "extending our front of attack" from the Moselle to Maastricht, for an advance through Belgium and Dutch territory to the lower Rhine. If Belgium and the Netherlands would not agree to this, and the French government was unwilling to override their neutrality, the prospect was dim. As this wider alternative was ruled out, Gamelin did not see any point in courting heavy loss and wearing down the French army's morale by pressing the attack on the Rhine-Moselle sector.

While Germany clearly benefited from the neutrality of Belgium and the Netherlands at this stage of the war, it was doubtful whether the alternative that Gamelin desired would have made any important difference to the fate of Poland. For the mobilization of the French army was not completed until Sept. 20, and the leading British army corps arrived at the front only in the first week of October, whereas most of Poland was overrun by the third week of September. But the prospects of subsequent resistance to a German offensive in the west might have been greater if the French armies had been permitted to advance into Belgium in September. The situation was radically changed with the collapse of Poland. The scales of forces in the west now tilted heavily to the German side, and the primary problem of the French was to assure their own defense. In these different circumstances, however, they still favoured the idea of an advance into Belgium, even if it could be carried out only after a German invasion of Belgium. That was a more questionable decision. Their own army was not well fitted to execute such a racing manoeuvre and establish itself firmly on a fresh line at short notice.

The widespread view that the French leaders were too defensive minded is a fallacy. During the months that followed the fall of Poland, Gamelin showed a hankering for the offensive and mooted various provocative moves to threaten Germany's flanks, even though he had to admit that the means were lacking. That urge to do something, however unpromising the chances, was stimulated by political criticism of Gamelin's "caution," particularly from Paul Reynaud, whose cry for bold and early action brought him growing political influence, as usually happens in a democracy at war. The pressure of such tendencies could be traced in the development of the French plan to meet a German invasion of Belgium. The first idea was that the two armies on the extreme left, the French 7th army and the British, should advance a short distance across the frontier and occupy a position along the Escaut river as far as Ghent, there linking up with the Belgian army, which was expected to fall back on the line Antwerp-Ghent. This was extended by November into plan D, which embraced a 60-mi. advance to the line of the Dyle, east of Brussels, and a general wheel forward of the French left centre to correspond. In March a third development in the plan gave it a still more venturesome turn. The French 7th army was to dash up the Belgian coast past Antwerp into the Netherlands, so that it could not only buttress the joint between the Belgian and Dutch armies, but strike at the flank of the Germans advancing into Belgium.

The plan and the distribution of forces expressed the twin convictions of the French high command. One was that the Germans would make their main effort in the plain of Belgium, north of Namur, as in 1914. The other was that no serious stroke could be delivered south of Namur, through the Ardennes, because of the difficulties presented by that hilly and wooded belt of country. This proved a fatal delusion. Yet if the German offensive had

been launched when Hitler intended, in November, Gamelin's plan might well have succeeded in checking it on the Dyle, while at the worst a decisive defeat of the French would have been unlikely. But Hitler's desire was repeatedly postponed by the weather, coupled with the hesitation of his generals. And when at last the German offensive was delivered, six months late, its plan had been so changed as to profit decisively from the nature of the French plan.

The centre of gravity was shifted from Gen. (later Field Marshal) Fedor von Bock's army group B on the right, facing the main plain of Belgium, to Gen. (later Field Marshal) Gerd von Rundstedt's army group A facing the wooded hill-belt of Belgian Luxembourg. The change was suggested by Gen. (later Field Marshal) Fritz Erich von Manstein, Rundstedt's chief of staff, who argued that the tank forces could be effectively used in the Ardennes, contrary to orthodox ideas, and that the risk of a check would be less than if they met the main mass of the Allied forces head-on in the centre of Belgium. Manstein's proposal was regarded as too hazardous by the heads of the German army; but its boldness appealed to Hitler, who, in March, secured its adoption. The French advance into Belgium now played into the hands of the Germans in the same way that the French advance of 1914 into Lorraine and the Ardennes had done. It was, however, the employment of fast-moving armoured vehicles, instead of foot-marching infantry masses, that made the vital difference to the result in 1940 compared with 1914.

The period that popular opinion christened the "phony war" was far from being such in reality. It was a period when the Allies were projecting offensive schemes which they lacked the power to execute, and when Hitler was repeatedly mounting an offensive, only to be compelled to defer it, contrary to his desire, but to his advantage.

2. German Conquest of the Low Countries and France. -Following the dramatic success of his April coup in Norway, Hitler became more eager to attempt the deferred stroke in the west. But it was not until May 7, 1940, that the first warning order since January was actually issued. On May 8 Hitler was "very agitated" by reports that the Dutch were accelerating their precautions and might allow the British to reinforce them. The invasion was launched in the early hours of May 10. Under the remodelled plan, Bock's army group B comprised two armies instead of the former three. The 18th army, under Gen. (later Field Marshal) Georg von Keuchler, invaded the Netherlands with the aid of an armoured division and air-borne forces, while the 6th army (Gen. Walter von Reichenau) advanced along the main avenue into Belgium, with the aid of an armoured corps. These two German armies had to deal with the Dutch and Belgian armies, the British expeditionary force (now grown to 13 divisions, of which 9 were available there) and 2 of the best-equipped French armies. Lacking superiority of numbers there, the Germans depended on surprise and superior skill. Rundstedt's army group A covered the stretch between the middle Meuse and the Moselle. Its strength had been raised to more than 80 divisions, of which 7 were armoured. Once it had brushed aside the screen of Belgian troops in the Ardennes it had only to deal with two French armies consisting of 12 infantry divisions—half of them low-grade—and 4 horsed cavalry divisions. Against this weak hinge of the Allied wheel forward into Belgium were massed nearly two-thirds of Germany's forces in the west, and nearly three-quarters of its armoured punch. Along the Franco-German frontier, between the Moselle and Switzerland, stood Gen. (later Field Marshal) Wilhelm von Leeb's army group C, comprising two armies. Its task was merely to threaten an attack on the Maginot line and thus pin down the excessively large proportion of the French forces that were arrayed there. For 41 divisions were posted in and behind that well-fortified sector, compared with 39 on the longer sector between the Maginot line and the Channel coast, while the larger part of the French general reserve was also on this flank. The responsibility for those fatal dispositions lay more directly with Gen. Alphonse Joseph Georges, the commander in chief of the armies on the northeast front, than with Gamelin. For the moment that danger was obscured by the dramatic opening of the campaign in the Low Countries.

(a) Conquest of the Netherlands.—The Dutch army comprised ten divisions and the equivalent of a further ten in smaller formations. It should thus on paper have had a very good chance of withstanding the German invasion, since its front was covered by successive rivers, while the attacking army comprised only seven divisions, apart from the air-borne forces. But the Dutch had a wide front, very sensitive and densely crowded rear, poor equipment in modern weapons and no experience of modern war. Apart from air superiority, the German offensive depended for its success primarily on the air-borne forces. Contrary to popular imagination after the event, these forces were on a small scale. Four parachute battalions were used, together with a regiment of air-transported infantry, to seize the bridges at Moerdyk, Dordrecht and Rotterdam, on the main road artery from the south into the heart of the Netherlands, with the aim of opening the way for the mobile ground forces. One parachute battalion, followed by two air-transported regiments, descended on the airfields around The Hague with the aim of capturing the main government buildings. The attack on the capital did not succeed, though it caused a lot of confusion and thus aided the invader's purpose. But the bridges were captured with very slight loss, and the defense was too disorganized to dislodge the troops who had dropped out of the sky before they were reinforced by forces arriving overland.

While the invasion could hardly have triumphed without this capture of the backdoor, the air-borne coup would have mattered little if the Dutch front had not broken down at a specially vulnerable spot.

Gen. Hendrik Gerard Winkelman, the Dutch commander in chief, was mainly concerned to cover the direct approach into the heart of the Netherlands. Out of his four army corps, two were massed on the Geld valley position, between the Maas (Meuse) and the Zuider Zee, while another was in reserve behind them. The remaining corps had held the Peel line south of the Maas; but, just before the invasion came, the Dutch command came to the conclusion that it would be safer to concentrate on holding the central part of the Netherlands, covered by the great rivers. So the army corps in the south was withdrawn, leaving the Peel line to be held by a'screen composed of lowergrade troops who lacked antitank and anti-aircraft guns. Nothing could have been better designed to suit the German aim of bringing quick reinforcement to the air-borne troops near Rotterdam.

On May 10 the Germans penetrated the Peel line. The next day the defenders retreated due west past Tilburg toward Breda, thus leaving a clear road by which the solitary German armoured division could drive northwestward to the Moerdyk bridge. That same afternoon the leading mobile troops of Gen. Henri Giraud's French 7th army reached Tilburg, after a remarkable 140-mi. dash

from the French frontier. Disconcerted by the Dutch retreat and German air attack, they fell back on Breda. By May 12 they had been reinforced but made no serious attempt to advance over the farther ten-mile strip to the Maas and bar the German armoured division's passage to Moerdyk. This reached the outskirts of Rotterdam soon after midday. Meanwhile, the main German forces had spent two days in closing up to the Geld valley line. On May 12 they made a narrow breach in it. Lacking reserves on the spot for effective counterattack, the Dutch command decided to abandon this line and fall back on the "fortress of Holland" line, just in front of Amsterdam and Utrecht. Its defense was never tested; for by the time the Germans closed up to it, late on May 14, the campaign had been brought to an end.

The Germans had made no progress at Rotterdam on May 13, and their situation there might have again become precarious since it formed a narrow wedge thrust far forward between the Dutch and French forces. But it was difficult for the Dutch to see the situation in such a light. They were more conscious that most of their country had been swiftly overrun and that the roar of German aircraft filled their ears. The queen and the government sailed for England on May 13, leaving the country in charge of General Winkelman. By the next afternoon he had decided to surrender. That decision was produced not only by the blackness of the outlook but by the threat of bombing the cities of Rotterdam and Utrecht if resistance continued. Such action was in accord with the old laws of warfare governing the bombardment of besieged places, since both cities were now in the fighting zone. But its technical legality did not diminish its inhumanity as a means of moral pressure. Rotterdam was actually bombed, through a fault in signal communications, after the Dutch had yielded to the threat. The horror it produced was shown in the way the statement that this bombing, by a mere 30 planes, had killed 30,000 people was credited, and continued to be believed long after bombings of 10 times such a scale had been found to kill only a fraction of the figure.

(b) Conquest of Belgium, First Phase.—The direct invasion of Belgium was made with stronger forces than were used against the Netherlands, but with only a handful of air-borne troops. Reichenau's 6th army deployed 4 army corps abreast on the 30-mi. Roermond-Aachen front and also included Gen. Erich Hoeppner's armoured corps. The air-borne troops consisted of a mere 500. To compensate for the shortage, dummy parachutists were dropped over a wide area, thus accounting for the reports that "thousands of parachutists" were descending on the country. At the start of the invasion of the west, the main weight of the German air force, of the dive bombers in particular, was concentrated on the gateway into Belgium, before being switched south to help in the passage of the upper Meuse around Sedan. That concentration of air bombardment was the invaders' biggest asset in gaining an ascendancy over the Belgian defense. The tiny element of air-borne troops, however, counted for almost as much. For it was they who secured the keys to the gate.

The most delicate point of the Belgian forward position lay north of Liége, where the Maastricht "appendix" of Dutch territory protruded between the Belgian and German frontiers, forming an indefensible strip that could mask an approach to the Albert canal, which there formed the Belgian frontier line. The invaders' chances turned on gaining the bridges at that point before they could be

blown up, and preventing the guns of Eben Emael, Belgium's most modern fort, from dominating them subsequently. Early on May 10, before it was light, a platoon in gliders landed at the back of each bridge and captured each intact. Other gliders landed on the top of Eben Emael and dropped explosives into the guns and the exits unobserved by the garrison inside-which was thus helplessly imprisoned in its now useless fort. By the morning of May 11 sufficient German troops had accumulated beyond the canal to burst through the Belgian line. The leading armoured division now drove through to the west, while part of the infantry wheeled south and entered Liége from the rear. That evening the Belgian command (King Leopold III, commander in chief; Gen. F. F. O. Michiels, chief of staff) ordered a general withdrawal to the Antwerp-Namur (or Dyle) line, where the leading Allied divisions had just arrived-the French 1st army (under Gen. Georges Blanchard) occupying the sector from Namur to Wavre, the British (under Viscount Gort) occupying the sector from Wavre to Louvain, while the Belgians wheeled back to hold the sector from Louvain to Antwerp.

In view of the imminent collapse of the Belgians' forward position, the French advance to the Dyle line had been accelerated on May 11, and from there Gen. René Prioux's cavalry corps (of two light mechanized divisions) pushed on eastward to meet the Germans. It was too late to check the break-through on the Albert canal, but it helped to cover the Belgians' retreat from Liége. Falling back by stages, Prioux checked a series of German tank thrusts on May 12-13. During the second night his corps withdrew to an antitank obstacle a few miles in front of the main position. On May 14 the Germans made a powerful effort to break through in the direction of Gembloux, and a big tank battle developed. Although Prioux prevented a complete break-through, his corps was so badly mauled by the afternoon that it had to be withdrawn to reorganize behind the main position, which was now solidly occupied by the rest of the 1st army. When the Germans attacked the next morning, they were checked. Immediately afterward, Hoeppner's armoured corps was sent south to join Rundstedt's army group. Its disappearance appeared to increase the French prospects of holding this end of the Dyle line, while no pressure at all had yet developed on the British sector. But on the evening of May 15 Gamelin ordered its abandonment. For by then Rundstedt's armoured forces, which had crossed the Meuse at Sedan on May 13, were driving deep into France. It had now become a question for the Allies, not whether they could hold out in Belgium, but whether they could escape being cut off there.

(c) Thrust into France.—The break-through from the Ardennes across the Meuse turned more on the approach march than on the battle. The passage of such great forces through such a difficult belt of country as the Ardennes was an amazing feat of staff work. Rundstedt's army group comprised, from right to left, the 4th army (Gen., later Field Marshal, Guenther von Kluge), the 12th army (Gen., later Field Marshal, Siegmund List) and the 16th army (Gen., later Field Marshal, Ernst Busch), while the 2nd army (Gen., later Field Marshal, Maximilian von Weichs) was in reserve. But its thrust was provided by two armoured groups: a large one under Ĝen. Paul von Kleist and a smaller one under Gen. Hermann Hoth. The solution of the approach march problem was both bold and ingenious. While the armoured divisions used such roads as were available through that hilly and wooded belt, infantry divisions started alongside them by using field paths and marched so fast across country that the leading ones reached the Meuse only a day after the armoured divisions.

Early on May 10 Kleist's leading troops crossed the frontier of Luxembourg, where they met only road obstructions. In three hours they reached the frontier of Belgian Luxembourg, 30 mi. beyond. There they found bridges blown up and met opposition, first from the Belgian Chasseurs Andennais and then from French horsed cavalry. The French paid forfeit for pushing old-lashioned cavalry divisions deep into the Ardennes in face of armoured divisions. By the next evening they were driven back across the Semois in disorder and had suffered such losses as to ease the Germans' task in forcing the difficult passage of that river. Georges now ordered reinforcements to that sector, but their arrival was too slow to match the German rate of movement.

By the evening of May 12 the Germans were across the French frontier, and overlooking the Meuse. The blow was about to fall not only on the hinge of the French advance into Belgium but on the joint between two armies: Gen. Charles Huntziger's 2nd army and Gen. André Corap's 9th. Huntziger's left wing, from Sedan eastward, was composed of two reserve divisions of oldish men. Corap's right wing, west of Sedan, was of similar composition. The defenses were rudimentary; it was the least fortified stretch of the whole French front. Worse still, they had hardly any antitank guns and no anti-aircraft artillery. Such was the measure of the trust placed in the unlikelihood of an armoured thrust through the Ardennes.

On May 13 Kleist's forces achieved a three-fold crossing—by Gen. Heinz Guderian's corps at two points near Sedan, and by Gen. Georg Hans Reinhardt's corps at Monthermé. At Sedan, wave after wave of dive bombers swooped on the defenders of the south bank. These could not stand the nerveracking strain, and the German troops were able to push across the river in rubber boats and on rafts. The tremendous air bombardment was the decisive factor in the crossings. A thousand aircraft supported Kleist's forces while only a few French aircraft intervened in a gallant but hopeless effort to aid their troops on the ground. On May 14 the breakout began, after the tanks had crossed the bridges. Guderian's corps swung westward, its nose pointed to the Channel coast. The French collapse spread next day as Reinhardt's corps joined in the pressure.

There was no "battle of the bulge," such as was vividly described in the Allied reports at the time. It was a procession in quick time along an almost empty corridor behind the backs of the Allied armies in Belgium. Meanwhile, further crossings had been made to the west, between Givet and Namur. Thus, in two days the breach had widened to 60 mi., and any French positions remaining had become mere islets lapped and left behind by the waves of the armoured torrent that was now sweeping through the corridor between the Sambre and the Aisne. Giraud was now sent to replace Corap and reinforcements followed. But there again the measures were inadequate and taken too late. When he arrived, on May 15, he drew up a plan for a counteroffensive to block the corridor on a line 25 mi. west of the Meuse. But a day later he found that the forces were not available, while the Germans had advanced in strength far beyond their line. So he now decided to withdraw to the line of the Oise, 30 mi. farther back, and block the Germans there. Once again he was too late, for the German armoured divisions outran his retreating troops and were across that barrier on May 17. Even if the French had been able to mount a counteroffensive, they would not have found it easy to crush the invaders' flank. For Kleist's southern flank was progressively lined by his motorized divisions, which in turn were relieved by the infantry corps that were marching on as fast as possible.

This lining of the Aisne had an important indirect effect-by playing on the most instinctive lear of the French. For on May 15 Gamelin received an alarming report that the Germans were crossing the Aisne between Rethel and Laon. He told the government that he had no reserves between that sector and Paris and that he could not guarantee the security of the capital for more than a day. After Gamelin's startling message the French premier, Reynaud, hastily decided to evacuate the government from Paris to Tours. By evening more reassuring reports came from the Aisne, and Reynaud went to the radio to broadcast a denial of "the most absurd rumours that the government is preparing to leave Paris." At the same time he seized the opportunity to replace Gamelin, and for that purpose summoned Gen. Maxime Weygand from Syria. Weygand did not arrive until May 19; and thus for three critical days the supreme command was in a state of mental, though not actual, suspense.

While the Allied statesmen, like their peoples, were still dreaming of an attack that should cut off the "bulge," the German armoured forces raced on to the sea and cut off the Allied forces in Belgium. The remaining obstacles that could have blocked the tanks were not manned in time on an adequate plan. After crossing the Oise on May 17, Guderian's advanced troops reached Amiens the next day. On May 20 they swept on and reached Abbeville, thus blocking all communications between north and south. By the next day the motorized divisions had taken over the line of the Somme from Péronne to Abbeville, forming a defensive flank barricade; and Guderian's corps turned north up the coast in a drive for Calais, while Reinhardt's, swinging south of the British rear position at Arras, headed for Dunkirk.

(d) Conquest of Belgium, Final Phase.-After abandoning the Dyle line on May 16 the Allied armies in Belgium had wheeled back to the line of the Escaut (or Schelde). By the time they arrived there, the position had been undermined by the cutting of their communications. On May 19 Gort began to consider the necessity of evacuating the British expeditionary force by sea, and the preparatory steps entailed. Next day, however, orders came from the cabinet that the B.E.F. was to march south on Amiens. Gort argued that such a long-range drive in reverse was not practicable, either tactically or administratively. All he could manage was an attack by two divisions, which had just been rushed south to Arras for the purpose, led by a brigade of infantry tanks, the only armoured troops he had. When this riposte was launched on May 21, it comprised no more than two tank battalions backed by two infantry battalions, while elements of one French light mechanized division covered its flanks. Nevertheless, this small drive into the corridor momentarily shook the nerve of the German higher command. The effect showed that if two or three armoured divisions had been available for a concentrated counterstroke, the German advance might have been dislocated.

After this flash-in-the-pan the Allied armies in the north made no further effort to break out of the trap, while the belated relieving push from the south was so feeble as to be almost farcical. The prevailing confusion was increased by Weygand's arrival to take over supreme command. This veteran of 1914–18 was better in expounding theory than in grasping reality, and even his theory was out of date. His

grandiloquent orders had no more chance of being translated into practical terms than those of Reynaud and Churchill. While the governments and commanders got into a tangle of divergent views and orders, the cut-off armies in the north fell back on a slant closer to the coast under increasing pressure from Reichenau's advance through Belgium. More dangerous still was the backdoor approach of Kleist, whose armoured forces were sweeping north past Boulogne and Calais. So three of Gort's divisions were pulled out of the front and sent south to strengthen the line of canals that covered Dunkirk and the Allies' rear. Two more were allotted for Weygand's renewed project of a Franco-British drive down into the German corridor. But then the Belgians' extended right flank, adjoining the British, gave way under Reichenau's pressure; so these two divisions were rushed north again. By the time they arrived on May 27, the Belgian centre had cracked; and there were no reserves to fill this fresh gap. With their country overrun and their backs to the sea, in a small strip crowded with refugees, the Belgians were driven to sue for an armistice that evening; and the "cease fire" was sounded early next morning.

Even before the Belgian capitulation, the British government had decided to evacuate the B.E.F. by sea from Dunkirk, and the admiralty had been collecting every kind of small craft to help in bringing away the troops. The retreat to the coast now became a race to re-embark before the German pincers closed. As the troops had to be taken off from the beaches, it was a slow and difficult process, extending from May 26 to June 3. In the end 233,039 British troops were brought away, as well as 112,546 Allied troops, mainly French, though most of the equipment had to be left behind. The evacuation could not have been achieved but for the air cover provided by fighter aircraft from the English coast, the indomitable efforts of the seacraft and the good discipline of the troops. It was Hitler, however, who did most to make their escape possible. For the German armoured forces had reached and crossed the canal defense line close to Dunkirk as early as May 23, when the bulk of the B.E.F. was still far distant from the port. Just as they were expecting to drive into Dunkirk, they were suddenly halted by Hitler's order and actually pulled back to the canal line. Hitler subsequently explained his intervention as the result of his desire to preserve the armoured forces for the next stage of the offensive in France; but some of his generals believed that he had a deeper reason, the idea that Britain would be more likely to make peace if its pride was not wounded by seeing its army surrender. After three days Hitler withdrew his veto and Kleist started to advance again, but the opposition was now reinforced, and almost immediately he received fresh orders-to turn south for the attack on the Somme line. Reichenau's army followed, leaving Keuchler's to clear up things in the north, where more than 1,000,000 prisoners had been taken in the 3 weeks' campaign, at a cost of 60,000 German casualties.

(e) Collapse of France.—The new French front along the Somme and the Aisne was longer than the original one, while the forces available to hold it were much diminished. The French had lost 30 of their own divisions in the first stage of the campaign, beside the help of their Allies. (Only two British divisions remained in France, though two more that were not fully trained were now sent over.) In all, Weygand had collected 49 divisions to cover the new front, leaving 17 to hold the Maginot line. The Germans, by contrast, had brought their 10 armoured divisions

up to strength again with relays of fresh tanks, while their 130 infantry divisions were almost untouched. For the new offensive the forces were redistributed, two fresh armies (2nd and 9th) being inserted to increase the weight along the Aisne sector (between the Oise and the Meuse); Guderian was given command of a group of two armoured corps that were moved to lie up in readiness there. Kleist was left with two corps, to strike from the bridgeheads over the Somme at Amiens and Péronne respectively, in a pincer move aimed to converge on the lower reach of the Oise near Creil. The remaining armoured corps was to advance between Amiens and the sea.

The offensive was launched on June 5, initially on the western stretch between Laon and the sea. Resistance was stiff for the first two days, but on June 7 the most westerly armoured corps broke through on the roads to Rouen. The defense then collapsed in confusion, and the Germans met no serious resistance in crossing the Seine on June 9. Kleist's pincer stroke did not, however, go according to plan. The left pincer, from Péronne, was hung up by tough opposition north of Compiègne. The German supreme command then decided to pull back Kleist's group and switch it east to back up the break-through that had been made in Champagne. The offensive there did not open until June 9, but then the collapse came quickly. As soon as the infantry masses had forced the crossings, Guderian's tanks swept through the breach toward Châlons-sur-Marne and then eastward. The drive continued at racing pace, over the Langres plateau to Besançon and the Swiss frontier, cutting off all the French forces in the Maginot line.

On June 10 Italy declared war. An Italian offensive, however, was not launched until ten days later and was then easily held in check by the weak French forces. On June 11 Churchill flew to Tours in a vain effort to encourage the French leaders. Next day Weygand addressed the cabinet, told them the battle was lost, blamed the British for both defeats and then declared: "I am obliged to say clearly that a cessation of hostilities is compulsory." There was little doubt that he was correct in this estimate of the military situation, for the French armies were now splitting up into fragments. The cabinet was now divided between capitulation and a continuance of the war from North Africa but decided only to move itself to Bordeaux.

The Germans entered Paris on June 14 and were driving deeper on the flanks. Two days later they reached the Rhône valley. Meanwhile Weygand had continued his pressure for an armistice, backed by all the principal commanders. Reynaud resigned, whereupon a new cabinet was formed by Marshal Henri Philippe Pétain, and the request for the armistice was transmitted to Hitler on the night of June 16. Hitler's terms were delivered to the French envoys on June 20. The German advance proceeded beyond the Loire while discussion continued, but on June 22 the German terms were accepted. The armistice became effective at 1.35 A.M. on June 25, after an accompanying armistice with Italy had been signed the day before.

3. The Siege of Britain.—No plans had been made for the invasion of Britain when the Germans launched their offensive. Nor were any made even when the collapse of France was assured. It is clear that Hitler counted on the British government's agreeing to a compromise peace on the favourable terms he was disposed to offer and had no desire to press the conflict to a decisive conclusion. The German army was given to understand that the war was over, leave was granted and part of the luftwaffe was shifted to other quarters. Even when Churchill's determination to continue the war was manifest, Hitler still clung

Ominous vapour trails in a London sky during a raid by the German luftwaffe. Until the 1944 campaign of flying bombs, the nazi "air-blitz" over England was most concentrated during 1940—41, with heaviest damage occasioned by night raids

to the belief that it was merely a bluff, feeling that Britain must recognize "her militarily hopeless situation." That hope of his was slow to fade. It was not until July 2, 1940, that Hitler even ordered a consideration of the problem of invading England, and he still sounded a note of doubt about its necessity when at last, on July 16, he ordered preparations to begin for such an invasion, christened Operation "Sealion." But he said that the expedition must be ready by mid-August 1940.

The German army was in no way prepared for such an undertaking. The staff had not contemplated it, the troops had been given no training for landing operations and nothing had been done to build landing craft for the purpose. So all that could be attempted was a hurried etfort to collect shipping, bring barges from Germany and the Netherlands and give the troops some practice in embarkation and disembarkation. It was only the temporary "nakedness" of the British forces, after losing most of their equipment in France, that offered such an improvisation the possibility of success. The main operation was entrusted to Field Marshal von Rundstedt's army group A, which was to use the 9th and 16th armies, comprising 25 divisions. Starting from the various harbours between the Schelde and the Seine estuaries, they were to converge on the south coast of England between Folkestone and Worthing, while air-borne troops were to capture the cliff-covered Dover area. According to the plan, ten divisions were to be landed in the first four days, to establish a wide bridgehead. After about a week the main advance inland would begin, its first objective being to gain the high ground along an arc from the Thames estuary to Portsmouth. In the next stage, London was to be isolated from the west. If opposition were stiff, the 6th army (from army group B) might be landed west of Weymouth for a push northward to the Severn.

The German generals were very apprehensive of the risks that their forces would run in crossing the sea. They had little confidence in the capacity of either their own navy or the luftwaffe to keep the passage clear. The German admirals were even more frightened about what would happen when the British navy appeared on the scene. They had no confidence in their own power to stop it and insisted that the responsibility must be placed on the luftwaffe. Hermann Goering, however, expressed assurance that the luftwaffe could check British naval interference as well as drive the British air force out of the sky. So it was agreed that he could try his preliminary air oftensive, which did not commit the other services to anything definite, while the time for the invasion attempt was postponed to mid-September.

During July and early August a rising stream of air attacks was delivered against Britain's convoys and ports. Then on Aug. 13 the main offensive was unleashed, mitially against air bases. Although targets and tactics were changed in different phases, the underlying object was always to wear down Britain's air defense, and the effort was maintained far into September. Although it severely strained the limited resources of fighter command, under Air Chief Marshal Sir Hugh Dowding, the German losses in both bombers and fighters were disproportionately heavy. Aug. 15 and 18, Sept. 15 and 27 were the luftwaffe's days of greatest loss in the long series of air battles over Britain. As the expensiveness of the daylight attacks came to be impressed on the luftwaffe, the offensive effort was increasingly diverted into the channel of night raids on Britain's industrial centres. Although the nightly "blitz" imposed a great strain on the civilian population, beside impairing war production and food supply, it contributed

little to the main purpose that had prompted the air offensive. (See Battle of Britain, below.)

The evident inability of the luftwaffe to dominate the sky increased Hitler's hesitation to take a decision on Operation "Sealion." Orders he issued on Aug. 16 hinted at further delay. On Sept. 3 the date of invasion was deferred to Sept. 21, and then on Sept. 19 he ordered the shipping to be dispersed. On Oct. 12 he announced that the operation was off for the winter, though a pretence of preparations was to be kept up. Long before the spring came he had decided to turn eastward against Russia, and plans for the invasion of Britain were definitely discarded. Rundstedt and other generals had doubted all through whether his intentions were serious, in view of the apparent lack of interest and impetus on his part compared with the way he had spurred on the preparations for other offensives. The campaign against Britain henceforth became purely a blockade of its sea approaches, conducted mainly by the German submarines, supplemented by the luftwaffe.

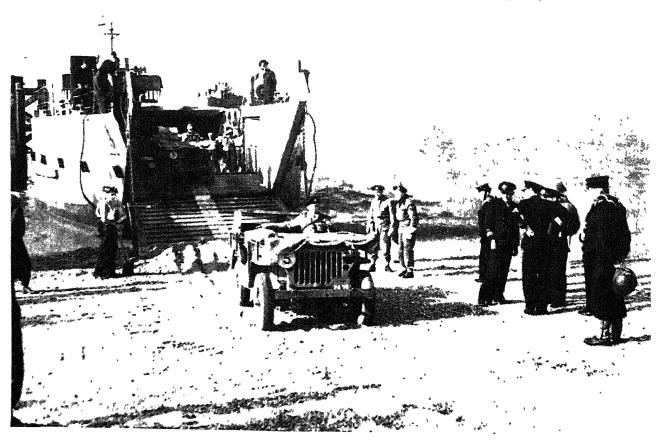

4. British Amphibious Raids.—The number of operations carried out by the commandos (q.v.) during World War II was small, but they had a tonic effect on British national morale during the depressing period of isolation and siege that followed the enforced evacuation of the continent by the British forces in 1940. They helped to show that the German hold on the continental coast line was not completely secure, and they secured valuable experience for future amphibious operations on a larger scale. While the German command had reason to welcome these occasional raids as a help in keeping its own troops alert, it became uncomfortably impressed by such evidence

of the excessive stretch of coast it had to cover as a result of its conquests. The commando operations were also valuable as a school in the application of irregular tactics to regular warfare, correcting the normal tendency of armies to develop formal habits and stereotyped methods.

The earlier raids had as their main target the fish-oil plants in Norway that were used in the making of glycerine for explosives; destruction of shipping was one of the subsidiary aims. The first raid was carried out-by the British commandos, light naval forces and Norwegian marinesat the head of the Vestfjord off Narvik, on March 7, 1941. The next was a purely Norwegian raid, at Oksfjord, between Tromsö and Hammerfest on the night of April 11. On Dec. 27, a larger raid, mainly by British forces, was delivered against the island of Vaagsoey. In 1942 commando operations were switched to the Atlantic shores of occupied France. The first was on the night of Feb. 27 at Bruneval, near Le Havre, where the secrets of the radar station formed the main objective. Some parachute troops co-operated in this very successful small operation. A more ambitious one was attempted at St. Nazaire on March 28 and did considerable damage to the harbour works, though at a rather high cost. On April 22 there was a small raid near Boulogne.

A much bigger operation was attempted at Dieppe on Aug. 19, 1942. Officially described as a "reconnaissance in force," it furnished useful lessons for the future in the problem of invading a well-defended coast. Although the cost was very high, it showed the possibility of achieving a large-scale landing under modern conditions, while bringing out mistakes that were to be avoided. In this operation, the commandos played only the preparatory

Troops debarking from an invasion barge on a British beach after the Allied raid on Dieppe Aug. 19, 1942

role, in the form of a dual flanking move. The right-hand thrust was successful in disabling the coastal guns on its sector, but the left-hand thrust miscarried, it unluckily ran into a German flotilla before the landing. The main assault was carried out on the beaches of Dieppe, by a mainly Canadian force of about 7,000 men, and tanks were employed to help it, though their efforts were seriously obstructed by the sea wall. Nearly half the assaulting force was lost, largely as prisoners. Losses in landing craft and aircraft were also heavy, though in the air a compensating toll was taken by the great Allied "umbrella" of about 1,000 fighters.

(B. H. L. H.)

5. Air Warfare over Western Europe, Germany, Mediterranean and Italy.-Germany used its air force from 1939 to 1944 mainly as an adjunct to offensive military and naval operations; but by the beginning of 1944 it was forced to switch to the defensive because of the Allied air campaign against its industrial area. Thereafter, German offensive action was largely limited to mechanical weapons, first the flying bomb or V-1 and later the big rocket or V-2. Allied air strength in the earlier period had been built up from a condition of numerical inferiority to an overwhelming preponderance. Victory in the long run depended largely on the Allies' success in expanding and deploying their air forces and on the failure by Germany to prevent this. If the German air force could have smashed the British aircraft industry between 1940 and 1942 or the Russian aircraft industry after 1941, or stopped the flow of U.S. aircraft to Britain after 1941 or prevented the movement of air forces to North Africa, the eastern Mediterranean and Russia, it could have changed the course of the war. It achieved none of these tasks; as a strategical weapon, German air power failed.

Allied air effort, whether its strength warranted it or not, always took account of strategical as well as tactical needs until the two merged into one with the invasion of Germany. By that time it had disorganized German production and transport, saleguarded Allied bases and had given vital support to the ground forces in a series of campaigns.

This continuous and mounting attack on the sources of axis power formed the background to the campaigns. It went on in retreat and in advance. It rose at last to an intensity never before imagined. While the armies of Germany and Italy were being forced back, the whole economy of their homelands was being destroyed. High on the program of destruction were the aircraft industry and the oil needed by the axis air forces. When finally the Allied armies crossed the Rhine in the last stages of the war, there was practically no interference from the German air force.

(a) The Success of the Blitzkrieg.—Most of the nations Germany attacked between 1939 and 1941 were in a position similar to that of Germany at the end of the war. The one exception was Russia. When Germany invaded Poland in Sept. 1939 it had about 5,000 first-line aircraft. Nearly 2,000 of these were used in the campaign. Poland could muster at most 600 aircraft; the German aim was to put these out of action first. In two weeks this purpose had been achieved, and German air units could concentrate on turning retreat into confusion and on spreading terror among civilians. The entire campaign cost Germany only about 200 aircraft. When the Germans invaded Norway in April 1940 the air defense was equally inadequate, and it was impossible for the British to reinforce the Norwegian army.

Ship-based aircraft, few in numbers, backed up by only two land-based fighter squadrons, could not compete with the German land-based aircraft of superior performance. Thus, a second campaign was decided in the air. When the main thrusts were delivered into the Netherlands, France and Belgium, the German air operations resembled those of the Polish campaign, with some innovations. Again the resistance was weak. About 3.500 aircraft were used by the Germans. Against these France had a total of 2.500, but never many more than 1,000 aircraft in its first-line strength. The British air strength in France did not exceed 500 aircraft. Heavy air fighting took place, and the Germans suffered serious losses especially among their dive bombers; but they were too well supplied with aircraft to be checked.

In the Netherlands, parachute troops were used in force for the first time. About 20,000 were dropped chiefly in the neighbourhood of Rotterdam; this action was preceded by an intense bombing of the dock area of the city which caused great loss of life. On other parts of the 250-mi. front, German aircraft attacked airfields and communications, broke down resistance in front of their troops, put up a defensive umbrella over their advancing columns, bombed and fired at refugees on the roads and took every opportunity to create chaos in the rear of the opposing armies. By way of breaking the spirit of the French, there were raids on certain towns, including one by 120 bombers on military objectives around Paris. Meanwhile the relatively small force of the royal air force continued to cover the British retreat to Dunkirk and to oppose to the limit of its powers the advance of the Germans. The bombing of towns by the luitwaffe had released the British from their inhibitions concerning targets where civilians might be involved. During the German advance there were frequent attacks on railway yards, oil supplies and road junctions in western Germany. In the air fighting near Dunkirk, the Germans had a taste of the opposition they were henceforth to meet. British victories in the air made the evacuation possible but could not impede the collapse of France. The German air force lost 2,000 aircraft in 6 weeks of fighting, yet after 6 weeks' refitting it was ready for the next venture, to prepare the way for the invasion of England.

(b) The Battle of Britain.—The Germans had available for this task about 3,000 aircraft. The British could put against them a fighter force about 800 strong; but this force was extremely well armed with 8-gun fighters, its aircraft carried armour over vital parts, its pilots were well trained and, perhaps most important of all, it was equipped with radar which had been brought secretly to a remarkably high state of efficiency. This apparatus detected formations at a distance of 50–60 mi. and revealed their strength, height and direction.

The Germans opened the battle of Britain on Aug. 8. 1940, with attacks on shipping and on south coast ports. For ten days they kept up this onslaught. From Aug. 12 they combined their campaign against shipping with raids on airfields, aircraft factories and radar stations in southeast England. On the whole they used about 500 aircraft a day; on some days, the figure reached 1,000. Throughout, losses were heavy. Failing to obtain the success they had expected, the Germans tried out various plans—night attacks on industrial towns in the Midlands, raids on the airfields of the home counties.

Early in September came attacks on London itself. The first was made by more than 400 aircraft; of these nearly a quarter were brought down. So heavy were the losses of the Germans in their daylight assaults that they turned to night bombing. Daylight raids continued, but they were

more a nuisance than a threat; the night raids were to trouble Britain for two years. Meanwhile an invasion fleet of barges had been assembling on the French and Belgian coasts and British bombers had been attacking it. Many barges were destroyed, but the danger of invasion remained an influence in British policy for many months and, together with the German campaign against shipping, curtailed British activity in other theatres of war. (See also Siege of Britain, p. 672.)

(c) The Defensive Phase.—When Italy entered the war in June 1940 there were fewer than 400 British aircraft in the whole middle east command; these had to look after the defense of Malta, the Suez canal and the Sudan and to undertake offensive operations in Libya, Eritrea, Italian East Africa and Ethiopia. The Italians, on the other hand, had a front-line strength of about 1.500 aircraft. Reinforcements from the air forces of Australia, New Zealand, South Africa and Rhodesia soon arrived in North and East Africa. Under the "cash-and-carry" airangement a certain number of U.S. aircraft, chiefly fighters and long-range reconnaissance types, were taken in British ships to Britain and thence to Africa. Later, under the lend-lease scheme, the flow was greatly increased.

The Italian air force was roughly handled wherever the British forces came into conflict with it. Axis ports on both sides of the Mediterranean were bombed. The British air units made up in dash what they lacked in numbers and equipment. Ship-borne aircraft had one outstanding success in Nov. 1940, when British planes caught some ships of the Italian navy at anchor in Taranto harbour and torpedoed seven, including two battleships. In the following April they took a major part in the battle of Cape Matapan. But for the most part, the British forces were at a disadvantage, especially in protecting convoys and in preventing the movement of traffic from Italian ports.

These difficulties came to a climax with the advance of the Germans through Yugoslavia to the Greek coast in April 1941 and with the capture of Crete by an air-borne force in May. This was the first example of an entirely air-borne campaign; it was preceded by intense bombing of the three airfields from which the small British fighter force operated. The latter became so reduced in size as to be ineffective against a raiding force about 500 aircraft strong and had to be withdrawn. Then the Germans dropped paratroops and glider troops, so that by the end of a week they had nearly 23,000 men on the island.

This evidence of German skill in air-borne invasion increased the anxiety felt in Britain. Night bombing had meanwhile grown in strength. Sometimes as many as 450 bombers attacked London in a night. A large part of the City had been destroyed by fire at the end of 1940. There had been heavy raids on other towns such as Coventry, Bristol, Birmingham, Liverpool and Birkenhead. Defense against night attacks was having little success mainly because single-seat fighters were being used and there was no room in them for an air-borne radar set and its operator. The possibility of an air-borne invasion by night was acknowledged. Home defense then remained a priority and alongside it stood the need to give more attention to the Atlantic battle.

German submarines were now working in packs, guided by scouting aircraft from advanced bases. Some of these aircraft made bombing attacks on merchant ships approaching Europe. With coastal bases all the way from Norway to the Spanish border in its hands, the German air force came near to making good the claim that air power could neutralize sea power. In the end, air power from British bases held down the German aircraft and checked the operations of the German submarines as well. Small escort carriers—converted merchant ships—came to be used in addition to naval escorts, and the R.A.F. steadily increased its long-range patrols until they were not only locating but fighting the submarines. By the end of the war, 415 out of the total of 781 submarines accounted for had been destroyed by air action. In this defense of Britain as a base, operations began near the shores of Britain and were gradually extended into the oceans until air cover was provided along all the convoy routes.

In the Mediterranean in 1941 there was a parallel situation in which the Germans held the majority of bases for controlling traffic in that sea, and the British were even less well equipped than they were at home. The Germans failed to knock out Malta and they paid heavily in every attempt they made to do so. Although the British were unable to prevent the transport of German troops from Italy to Africa, they did destroy the ships supplying these forces.

(d) The Offensive Phase.—The process of building up a British striking force in the middle east was slow and laborious. For two years the bulk of the fighting strength was in Britain and had to be used from Britain. Bombers and fighters went out whenever the weather was fit, by day and by night, to hamper German production and communications and to challenge the German air force in France. The daylight raids were intended to tie down units in France which might otherwise have been moved to the Mediterranean and Russia. Most British scruples were removed by the German incendiary attacks and so with the night raids began the campaign of systematic, wide-spread destruction which was afterward to make Germany the most devastated area in Europe.

Strategic bombing, aimed at Germany's power to feed the war machine, was gathering weight by the end of 1941. The first of the four-engined bombers had gone into action. Mounting production in Britain was adding to the numerical strength of the attack building up; new ideas in technique were also being introduced. The raid by 1,000 British bombers on Cologne on the night of May 30-31, 1942, introduced the "saturation" attack; the 1,000 aircraft delivered more than 2,000 tons of bombs within a period of 90 min. There was a repetition at Essen the following night and again at Bremen on June 25. This time the attack was completed in 75 min. It was the last 1,000bomber raid, but all this was the prelude to the series of heavy night raids which the R.A.F. continued right up to the end of the war. These were based on the "pathfinder" technique, by which radar was used to enable a specially trained advance party to locate the target and mark it with distinctive ground or sky markers, flares so powerful that their light could often be seen through clouds. On those marker flares the main body dropped its bombs.

During this period bigger and bigger bombs were used. At the end of June 1942 the 4,000-lb. bomb was introduced. By September the 8,000-lb. bomb was in use and a year later there was first a 12,000-lb. bomb and then a 22,000-lb. bomb for the uprooting of particularly difficult structures such as viaducts. Another important development in the early part of 1942 was the arrival of heavy bomber units of the United States army air forces and of fighter units to escort them on daylight attacks. The B-17 four-engined bombers specialized in precision bombing, and this was a consideration in deciding that the U.S.

heavy bombers should undertake the day bombing while the British Lancasters and Halifaxes should continue their night campaign From Sept 1942 the daylight campaign of the Americans, continually growing in volume was care fully co ordinated with the mounting night offensive of the RAF It was also supplemented by high speed unprotected attacks in daylight and in darkness by RAF Mosquito bombers, each capable of carrying one 4000 lb bomb or a selection of smaller bombs

While these developments were taking place in the west, Germans and Russians were both using their air forces to help their armies, much in the way that Germany had applied air power in its earlier campaigns. Air losses on both sides were heavy. The Russians, for instance admitted the loss of 4 500 aircraft in the first 2 months of the fighting in 1941. German losses in the same period were nearly 2 000. That winter and in subsequent winters. Germany withdrew some of its best air units from Russia to the western and Mediterranean fronts to be used against Britain.

On both these fronts, however, by the beginning of 1942 the British were beginning to assert superiority in the air. On the French front, this was shown in a series of provocative sweeps by day bombers and fighters which were later amplified by the addition of US army air forces and which cleared the way for the Normandy landings of June 1944. In the Mediterranean, the Allied air superiority expressed itself first in a close cooperation with the army and later also in the complete isolation of the axis forces in Tunisia from their sources of supply in Sicily and on the Italian mainland. It also amounted to air supremaced during the Allied crossing from Tunisia to Sicily, a crossing in which paratroops and glider troops were used in large numbers.

The technique of close co operation with the army had been carefully worked out during the see saw battles of the desert campaign Both strategical and tactical operations had been planned by the air force to serve the general military scheme Soon after the opening of the British offensive at El Alamein, the Anglo US lindings in Mo rocco and Algeria took place Nov 1942 and the limited axis air forces in Africa had to serve two fronts. They were already outnumbered in Egypt, and such was the spirit of the Allied air forces that they were outfought as well. As the Allied air forces moved up always within a few miles of the forward troops, their effectiveness against the axis line of supply from Italy was improved until neither reinforcement nor escape was possible for the troops in Tunisia The process of making the front too hot for the axis air forces was repeated in Sicily so that within a fortnight of the Allied landings not a single axis aero plane was based on the island

In the African campaign, the air operations of the Allics differed from those which the Germans had applied to their offensives in the sense that they stretched out farther beyond the battlefields and that they dealt with an opposition which, on occasions, was strong. In supporting the armies the Allied air forces employed fighter bombers which gave better help than the axis dive bombers and made successful use of rocket projectiles against armour and against shipping. As the Allies advanced northward through Italy, the Germans experimented with radio controlled bombs in attacks on ships, but the strength of Allied air cover soon made these of little consequence

British and U.S. air forces were now working together. The performance of the British air forces in the advance from El Alamein and of the united air forces in Sicily and Italy set the standard for subsequent operations in western

Europe, where the numbers of aircraft were greater and where powerful forces of heavy bombers could be fitted into the strategic plan. Before the Allied landings were made in Normandy, the German air force had been bombed out of its forward bases its radai had been disor ganized and its sources of supply and reinforcement had been attacked. Rullways in the whole of northwest France had been reduced by itticks on junctions and on rolling stock. Coastal fortiesses were smothered. A regular patrol of aircraft in the English channel kept submarines out of the course the invasion flect was to follow. The whole scheme of air protection and preparation was co-ordinated and directed toward the threefold end of pushing back the axis air defense of preventing air or sea interference and of isoliting the battlefield chosen by the supreme commander.

It succeeded beyond expectations, although Germany had had two years in which to convert its air force from an offensive into a defensive weapon. Its success undoubtedly owed much to its comprehensiveness. It brought Germany's production to a standstill, it crippled German communications at the same time it provided effective cover for allied strategy and close tactical support for the ground forces. In the Mediterranean, the method had been evolved and tested. In France and on through Belgium to the Rhine and beyond, it was applied with the full weight of the Allied resources and with the skill derived from experience.

The one factor which tended to divert and dissipate part of the Allied air effort was the introduction by the Germans of mechanical air weapons. Launching sites of the flying bombs and the rockets had to be attacked and fast fighters had to be used to intercept the flying bombs. When the armies advanced far enough to put these weapons out of action the war was nearly over and Germany's air power had been largely destroyed by air action.

(E C. Sp)

6 The German Occupation of Western Europe.—Under the terms of the Franco German armistice the northern half of France together with the whole of its Atlantic sea board remained in German occupation "Unoccupied France" was economically the poorer part and at the time of the armistice its problems were complicated by the fact that its population had been swollen by several million refugees from the north and from Belgium. The French sovernment under Mirshal Petiin, which was established at Vichy (q v) retained a nominal independence but was naturally subject to German control and interference. It was permitted to 1ct iin in aimy similar in size (100 000) to that which Germiny had been allowed under the Versailles treaty and also its navy, as well as its colonial em pire This concession which proved of great importance for the future was prompted not only by a desire to secure French co operation but by the Germans' naval weakness and consequent difficulty, when faced by the British navy in extending their tide of conquest to the French territories overseas

The other conquered countries of western Europe were completely occupied but the Germans sought, for their own convenience to get the administration carried on by officials of these countries, subject to German control A policy of conciliation was at first pursued. It corresponded to the ideas of the German military chiefs, who had learned the drawbacks of repression from the experience of World War I, while it also represented Hitler's desire to get these countries to accept their intended place in his "new Euro".

pean order" At first, that policy made considerable prog ress-largely because of the way the German troops ful filled the high command's instructions to behave with re straint and courtesy in the conquered countries. This polite behaviour combined with the German efforts to restore normal conditions began to win over a much larger proportion of the peoples than merely the instinctive collaborators Its prospects however were frustrated by the combination of Britain's continued defiance with nazi im patience and intolerance. Overbearing demands provoked resistance in occupied Europe leading to more drastic measures and thus to more widespread resistance in a rising spiral This resistance became increasingly organized with British support and caused the occupying forces more and more trouble as the war went on Beside the more active forms sabotage and guerrilla warfare (q v) there was a much more general passive resistance which had on the whole greater effect, without the legacy of licensed violence that in the former case often complicated the restoration of order after liberation

In France, where the resistance eventually became strongest it started with the handicap imposed by the Vichy government's tendency to avoid any such direct opposition to the conquerors as might worsen the plight of the French people At the same time, prior to June 1941 the leaders of the large Communist party advocated collaboration with the Germans against Britain—as the last European stronghold of 'western plutocracy' After the German invasion of Russia its attitude changed, and it started its own resistance movement. Others were also doing so on separate lines—Radical Socialist or Catholic The disunity of these movements hampered their effective ness, and in their discords they often played into the hands of the occupying forces, until a later stage

Outside France, Gen Charles de Gaulle had started his Free French" (later "Fighting French) movement as early as June 18, 1910 But he was able to collect only a few hundred in England, at Morval camp near Aldershot and support for him elsewhere was at first small. The censure of the Vichy government was a deterrent to many while confidence was shaken by the fiasco of De Gaulle's July attempt, under the protection of a British fleet, to seize Dakar on the West African coast But his prospects gradually improved as German impositions and the Vichy government's subservience brought an increasing flow of converts to his cause. The British entry into Syria in 1941 and Madagascar in 1942 paved the way for extension of his inthority Still more decisive was the US British occupa tion of French North Africa, in reply to which the Ger mans rushed to occupy the whole of France (Nov 11 1942) and turned the French people more definitely against them Although the French fleet at Toulon did not escape to join the Allies, it was scuttled rather than allow it to fall into German hands (Nov 27) Henceforth, there was a great development of the resistance in France, which was now better coordinated, while being more plentifully equipped with arms dropped by air All the different bodies were now unified under the CNR (Conseil Na tional de la Resistance), while the guerrilla sections were combined in a single organization entitled the FFI (Forces Françaises de l'Interieur)—though the Communist partisans retained a measure of autonomy

At the same time the regular forces under De Gaulle were growing fast A brigade under Gen Joseph Pierre Koenig played a gallant part in the British campaign of 1942 in Libya Larger forces were employed in the Tunis

ian campaign. The following year an army corps under Gen Alphonse Juin went to Italy and achieved the decisive manoeuvre through the mountains in the Allied offensive of May 1944 that led to the capture of Rome Meanwhile Koenig had taken over command of the FFI which severely harassed the German communications in France before and during the Allied invasion of Normandy On Aug 18 as the Allied armies approached the people of Paris rose in arms to liberate their city and a French armoured division was hurried thither to support their efforts. In the same week a French army under Gen Jean de Lattre de Tassigny formed part of the Allied landing in the south of France. It later achieved striking successes in the Rhine campaign. (B. H. L. H.)

E British African Campaigns

I East African Campaigns East Africa developed into an important battle arena in Aug 1940, about six weeks after the collapse of France At that time the British in desperate straits and girding for an expected nazi invasion of their homeland, were too hard pressed to spare troops for the African theatre To Mussolini, the time therefore seemed propitious to attempt an attack on British posses sions in Africa, and in August he launched an offensive against British Somaliland

The Italian strategy was simple and direct While their East African armies were to seize the British protectorate and close the southern outlet to the Red sea, Marshal Rodolfo Graziani's armies in the north were to advance across Egypt and seize the Suez canal Lacking adequate arms and troops in that area, the British had no choice but to depend upon a delaying action in order to main tain intact a strong concentration of troops in north Egypt for the protection of Suez

How unevenly matched were the Italian and British forces in that critical period is graphically illustrated by the following figures. Italy had an army of approximately 110,000 men in its East African empire. About 35,000 of these were stationed in Eritrea. An estimated 50,000 more were encamped in Ethiopia and the garrison in Italian Somaliland was said to amount to 10,000 troops. Addition ally, the Italians had numerous outposts near Kenya and Lake Tana, the chief reservoir of the Blue Nile in western Ethiopia. The British, on the other hand, had only the merest handful of men in East Africa. The peacetime strength of their forces in British Somaliland amounted to only 1,200. African soldiers led by 47 British officers. Al though this force was later implemented by some volunteers, it was no more than a token size army in Aug. 1940.

The actual invasion of British Somaliland began on Aug 4 along three routes. The Italians, using the greater part of two divisions, including some mechanized forces converged on Berbera, capital of the British protectorate. The British retreated hastily and by Aug 19 they were evacuated by sea from the threatened port

Substantial Italian forces also crossed into Kenya near Moyale, forcing the withdrawal of the weakly manned Brit ish outposts from the arid belt along Kenya's northern frontier At the same time, Italian troops in Eritrea pene trated the southern part of the Anglo Egyptian Sudan capturing Kassala and Gallabat Fighting in East Africa for the next five months was confined mostly to patrol skirmishes along the wild Sudanese and Kenya frontier regions

By Dec 1940 the British had gathered together a considerable army of British, Free French and Belgian regulars as well as Bengalis, Sikhs, Ethiopians and South Africans. The Allied armies in the Sudan consisted of about 40 000

men. Another 30,000 had been massed in the Kenya regions. In addition, a royal navy squadron weighed anchor for the task of blockading the sea outlets of Italian East Africa on the Red sea and the Gulf of Aden.

The Allied offensive began in early Jan. 1941 alter Gen. Sir Archibald Wavell's drive against Italian armies in North Africa was well underway. Wavell commanded operations in both the North and East African theatres. Striking southward from Sudan, an Allied force recaptured Kassala by Jan. 17, invaded Eritrea and started a rapid thrust toward the heavily defended Cheren-Asmara-Massawa triangle. Other Allied contingents operating from Kenya bases attacked Italian positions in Italian Somaliland and Ethiopia.

While Allied forces on the north met sharp resistance before Cheren in Eritrea, those invading Italian Somaliland broke through with relative ease. By Feb. the Allies crossed the Juba river and on Feb. 26 captured Mogadiscio, capital of the colony, climaxing a 220-mi. dash in 48 hours. By March 7 all Italian Somaliland fell to the British and most of the Italian troops in the colony were either killed or captured in the fighting. The Allied forces then swung inland, following the Webi Shebeli river into Ethiopia. Marching rapidly through the jungle wastes at a rate of 50 mi. daily, they sped toward the Addis Ababa-Djibouti railway. Meanwhile, British naval units in the Gulf of Aden succeeded in attacking and recapturing Berbera. This action, coupled with the other Allied offensives, served to immobilize and prevent counterattacks from the Italian occupation forces holding the rest of the British protectorate.

Meanwhile, the Italian garrison at Cheren, the key defense point of Eritrea, fought stubbornly, but on March 27 it evacuated the town after a seven-week siege. The capture of Cheren enabled the British to sweep up rapidly the remaining important points of Eritrea. Asmara, declared an open city, surrendered April 1 without a fight; a British-Free French detachment took Massawa May 9.

In Ethiopia the Italians were falling back toward Addis Ababa. The city of Harar fell the same day that Cheren was captured, and Allied troops moving on Diredawa captured that town and cut the Addis Ababa-Djibouti railway on March 30. Meeting little serious resistance, the British took Addis Ababa April 6, while the duke of Aosta, the Italian commander, retreated with the bulk of his army, most of whom were Ethiopians, toward Amba-Alagi. Although he rejected the initial British surrender terms, Aosta was hopelessly trapped and on May 19 he surrendered.

The capitulation of Aosta virtually sealed the East African campaign, although sporadic fighting by isolated Italian units continued until the end of September. By mid-July, the Allies not only reconquered British Somaliland but all of Italy's East African empire as well. Militarily, the British had secured the Suez canal from attack by the south and had gained an additional number of ports on the Red sea that could relieve Aden's overworked docks of the burden of naval repairs. (X.)

2. Egypt and Libya.—The campaigns under this head were dominated by three gifted commanders whose careers overlapped but whose ascendancy fell into three marked periods: Gen. Sir Archibald Wavell (until Feb. 1941), Field Marshal Erwin Rommel (March 1941–Aug. 1942) and Lt. Gen. Bernard L. Montgomery (from Aug. 1942).

Between El Agheila, near the Tripolitanian frontier, and El Alamein, about 60 mi. west of Alexandria, there was no naturally defensive position which could not be readily turned. There was only one road, along the coast.

There were several small, but, with the exception of Benghazi, only two large ports, Tripoli and Alexandria (each at the end of the respective lines of communication) by which to maintain major forces. Water supplies were, in parts, sparse. Apart from the Jebel Akhbar, the "bulge" of Cyrenaica which the Italians had attempted to colonize and which was outflanked regularly throughout the campaigns, the terrain was, in the main, flat and arid desert. Between Agheila and Alamein there was ample room for manoeuvre, particularly for mechanized forces; airfields were readily confected; moreover, save a small number of Arabs and, at first, a few Italian settlers, there were no civilians. The nature of the country with its solitary coastal road and the dispersion of its small ports gave the campaigns their pattern: a series of mechanized turning movements, outflanking "hooks" from inland while infantry hugged the coast, to secure a port which would nourish a further advance. "North Africa," said von Ravenstein, the commander of the 21st panzer division, "is a tactician's paradise and a quartermaster's hell."

(a) First Italian Offensive (Sept.-Dec. 1940). - When Italy declared war on June 10, 1940, there were more than 200,000 Italian troops in Libya and a considerable numerical superiority in aircraft. Thenceforward, British reinforcements had to reach Egypt via the Cape of Good Hope. With a detachment of the 7th armoured division on the Cyrenaican frontier, the main British positions were at Mersa Matruh 120 mi. farther east. From June 11, small British columns established an early dominance by harassing raids over the frontier, but on Sept. 13 after a heavy artillery program against the deserted escarpment above Es Sollum, the Italians invaded Egypt on a narrow front along the coast with two divisions up, two in rear and a further division and the Maletti group in reserve. Sidi Barrani was reached by Sept. 16. These forces, subsequently increased by 2 further divisions to a strength of 80,000 men, then distributed themselves, to remain for more than 2 months with ill-assured supply, in a series of fortified camps from Maktila, on the coast east of Sidi Barrani, to the escarpment about Sofafi, about 50 mi. away, in echelon from the left flank. Defenses lacked depth and mutual support. A gap of more than 20 mi. lay between Sofafi on the right and the next camp at Nibeiwa.

(b) British Counteroffensive (Dec. 1910-Feb. 1941).-After an approach march by night over open desert two highly mobile British divisions (7th armoured and 4th Indian) advanced on the gap. Complete surprise resulted in the rapid capture of Nibeiwa early on Dec. 9; and by nightfall the Tummar camps, immediately north, had almost completely fallen. Next day Sidi Barrani was retaken, and the ragged road to the west had been cut. In quick pursuit, the 7th armoured division intercepted a long Italian column between Buq Buq and Sollum, making its way back to the frontier. "Something is wrong with our Army," wrote Count Galeazzo Ciano on Dec. 11, "if five divisions allow themselves to be pulverized in two days." By Dec. 15 all Italian troops had been driven from Egypt, leaving more than 38,000 prisoners in British hands, and the majority of the Italian army remaining in Cyrenaica had withdrawn within the invested 17-mi. perimeter of Bardia. There was a pause for maintenance, reliefs and to utilize the port of Sollum, before Bardia fell, after a naval bombardment and a heavy attack from the west, to the 6th Australian division (which had relieved the 4th Indian division) on Jan. 5. About 45,000 prisoners and 462 guns were captured.

By the next day, the 7th armoured division had cut the road Tobruk-Derna and the track Tobruk-Mechili while the Italians abandoned their airfields at Gazala, Tmimi and Bomba. The southern face of the 28-mi. perimeter of Tobruk was attacked by the Australians on Jan. 21, with effective air and naval support, to capture the road junction Sidi Mahmoud 8,000 yd. inside the perimeter. The town capitulated next day with 38,000 more prisoners.

The remaining Italian forces in Cyrenaica tell into two main elements: the majority of the infantity east of Derna and a mechanized group about Mechili, the nodal point of the tracks south from the Jebel Akhdar and the direct westward route to Benghazi. While the Australians pushed into the Jebel, the 7th armoured division moved on Mechili. By Feb. 3 it was evident that the Italians were abandoning the "bulge," and great risks offered complete victory. The 7th armoured division was therefore swiftly directed on Msus with a tight maintenance margin to cut off the Italians south of Benghazi by moving northwest on Soluch or southwest on Agedabia as required. By Feb. 5, after a gruelling march in unreconnoitred desert, detachments were astride the main routes southwest of Beda Fomm, blocking escape into Tripolitania. Eighty-four Italian tanks were put out of action next day by the British pincers closing from Soluch and Beda Fomm. After an abortive attempt by 30 Italian tanks to break through at dawn on Feb. 7, Gen. Annibale Bergonzoli surrendered unconditionally. The Italian 10th army had thus been wiped out, and Cyrenaica was in British hands. During the two months following Dec. 7 the Army of the Nile advanced about 500 mi. It had destroyed an Italian army comprising 9 divisions and part of a tenth and had taken 130,000 prisoners, 400 tanks and 1,290 guns. In these operations Gen. Sir Richard O'Connor, Wavell's tactical commander, had never employed more than 2 divisions at a time, the 7th armoured division, "the Desert Rats," being engaged throughout. British casualties totalled 1,928 men. The bombardment and supply work of the royal navy had been remarkable while the royal air force, though most inferior in numbers, had gained complete superiority over the Italian air force.

(c) Second Axis Offensive (March-April 1941).-Wavell was compelled to gamble on a strategic shoestring. Uncertain on the one hand when German ground forces would reach Africa (where their aircraft were already operating) and pledged on the other, although Keren and Kismayu had still to be taken, to send to Greece what he could scramble together, he risked leaving the newly gained Cyrenaica with an understrength armoured brigade covering its western approaches and a new Australian division forming in the Jebel. British and German armoured cars first met on Feb. 20 and, before the month was out, German aircraft had made the port of Benghazi unusable. The maintenance of the slender British forces had therefore been thrown back on the long line to Tobruk when Rommel recaptured Agheila on March 24 and advanced in force through Marsa Brega on March 31 with the 5th light division (an experimental German formation subsequently converted into the 21st panzer division) and two mobile Italian divisions.

The British attempts to delay, first around Agedabia, to cover Benghazi, then on the line Derna-Mechili to cover Tobruk, were foiled by the faster and more powerful German tanks on the open flank. The Germans thrust in two main groups, one forcing its way through the Jebel on Derna, the other dashing via Msus across the open desert

on Tobruk. Having captured a British divisional headquarters at Mechili on April 8 and driven a small delaying loice back from El Adem to the Egyptian frontier, Rommel launched an ill-prepared attack on Tobruk on April 10–11, which was worsted after three tense days by the British gunners and Australian infantry who had withdrawn within the perimeter.

Their tanks requiring overhaul, the Germans, with Italians in attendance, settled down to prepare a less impetuous assault while the 15th panzer division moved up from Tripoli. The renewed attack went in on the night of April 30-May 1, but the Germans narrowly failed in their purpose, and Tobruk settled down to the rhythm of its long siege.

The escarpment running southeast from Sollum was gencrally impassable to vehicles for about 50 mi. inland save at Sollum itself and at Halfaya. While Tobruk remained besieged, operations on the Egyptian frontier developed into battles for possession of the two passes. Sollum and Capuzzo were captured by the British on May 15, only to be regained by the Germans next day. On May 27 the Germans took Halfaya in an operation ("Scorpion") beginning as a diversion for the battle of Crete. As a result of political pressure to relieve Tobruk, Wavell ordered an attack ("Battleaxe") over the frontier on June 15 designed to defeat the German armour in detail before advancing on El Adem. Capuzzo fell, but Halfaya and Sollum remained in German hands, and by the evening of June 16 additional German armour had arrived from outside Tobruk. Following an armoured battle south of Sidi Omar that night, the British began to withdraw after heavy tank losses, particularly from the German 88-mm. gun.

Rommel had already revealed the qualities which were to stamp his desert career: a forceful and inspiring personal leadership, disdaining either risk or advice, the requirements of maintenance and of his allies alike; a roughshod capacity to take advantage of his opponents' mistakes as rapidly as he recovered from his own; a tendency to improvise and to repeat his tactics; a liability to obsession.

Preoccupation with Tobruk conditioned the reorganization and accumulation of strength to which both sides devoted the long hot summer: one to capture, the other to relieve, the fortress. While eight Allied battalions in the front line dominated the four Italian divisions and three German battalions besieging the perimeter, the Allied naval and air forces tackled with redoubtable success the double task of keeping Tobruk alive and hamstringing the build-up and maintenance of the axis forces preparing to assault its mettlesome garrison. The Italian navy was not risking another Matapan; and between May and November no single axis convoy reached Tripoli or Benghazi unscathed; no single axis formation arrived in Africa complete. Meanwhile, Sir Claude Auchinleck succeeded the sagacious Wavell, who had been involved in six campaigns between February and July, and steadily built up his striking force (which became the 8th army), undisturbed in the desert itself save by an abortive raid to investigate his preparedness by the 21st panzer division over the frontier as far as Rabia on Sept. 14, and by the urgent and political need to change the personnel holding Tobruk.

The Italian forces under Gen. Ettore Bastico's supreme command (for the North African littoral as an Italian domain was perforce also in name an Italian theatre) totalled eight divisions, of which three (Ariete, Trieste and Trento) were formed into a mobile corps. The axis frontier defenses were strengthened by the fortification of Halfaya and Sidi Omar to increase the difficulty of frontal assault

and to extend any turning attempt. To release the 15th and 21st panzer divisions for their proper role, the 90th light division was created from positional battalions about Tobruk. Rommel proposed to hold off the British at the frontier while he attacked Tobruk on Nov. 23.

(d) Second British Counteroffensive (Nov. 1941–Jan. 1942).—The British attack ("Crusader") at dawn on Nov. 18, 1941, achieved complete surprise. Swinging an armoured corps wide across the frontier from Maddalena, the British sought to bring the German armour to battle, while on the inner flank another corps, having masked the frontier defenses, attacked northward to isolate Sollum and Bardia. The Tobruk garrison was to break out approximately southeast to join the relieving armoured corps. By Nov. 19 the British had seized the vital area of Sidi Rezegh southeast of Tobruk. Rommel replied by ordering the junction of the 21st panzer and Ariete divisions west of Bir el Gobi for attack eastward, while the 15th panzer division moved west from Sidi Omar.

By Nov. 23 the British plan had gone agley. Sidi Rezegh had been retaken, the sortie from Tobruk was stuck and the spearhead of the corps which had attacked north over the frontier was held at Gambut. While uncertainty existed in the British command, a mood relieved by Auchinleck's decision to take over personally, Rommel threw away his opportunity in a characteristic gamble to finish the battle quickly. Collecting all the armour he could muster on Nov. 24, he led a "dash to the wire," a raid over the frontier through the British lines, then swept north on a wide, incoherent front. His disruptive columns, having tailed to unseat the British from their essential purpose, swung back on Nov. 26 against the rear of the New Zealanders, who had by then pushed beyond Gambut to retake Sidi Rezegh. Next day the Tobruk garrison captured El Duda, making junction with the relieving forces on Nov. 27. The 21st panzer and Ariete divisions were therefore east and the 15th panzer division west of the corridor: the reverse of their dispositions when Sidi Rezegh had first been captured and some measure at once of the disruption which Rommel had created for himself and of

Firing from ground position, these British troops manned a British six-pounder antitank gun in the El Alamein sector, Egypt, before the 8th army's great drive against Rommel's Afrika Korps began

the whirligig of desert warfare.

By Dec. 1, however, the 15th panzer and the 9oth light divisions managed to break through the corridor to join the 21st panzer division at Zaafran. Rommel then again overreached himself and had to pull in his horns by abandoning the area east of the general line Bir El Gobi-El Adem. He began to withdraw from Tobruk on Dec. 7-8 and by Dec. 12, after expensive rearguard actions, the Germans had reached a line running southwest from Gazala with an open right flank. A heavy battle for disengagement ensued, but by Dec. 15 it was evident that Rommel's lines were both pierced and turned. He retreated to Agedabia, picking up a delivery of tanks from Benghazi en route. The British failed to cut him off and, after another enveloping attempt about Agedabia on Dec. 28-30, tried to contain the main axis forces in western Cyrenaica while they proceeded methodically to eliminate the isolated axis positions masked in the rear: Bardia, Sollum and Halfaya. Refreshed by the arrival of a convoy at Tripoli and by two Italian divisions, Rommel then withdrew into the strong Agheila position to refit: back where he had started.

(e) Third Avis Offensive (Jan.-Aug. 1942).—Nearer to his base, Rommel was ready first. Having probed British strength astride the coastal road on Jan. 21, he seized his advantage next day and rapidly captured Saunnu and Antelat. By Feb. 4 he had retaken Benghazi and driven the Allied forces back to their chosen line of resistance south from Gazala. He did not press home his attack on Feb. 14-15, and both sides settled down to prepare again for further advances while the race for supply was run, a phase demonstrating the immense significance of Malta, the "unsinkable aircraft carrier."

The Allied defenses were a straggle of irregularly spaced strongpoints, "boxes" linked by minefields. Most important was that at "Knightsbridge," a track junction where the Trigh Capuzzo running west from El Adem crossed the north-south track between two further "boxes," Acroma and Bir Hacheim. South and east of Bir Hacheim the left flank lay open. Rommel planned a swift drive round this flank to capture Bir Hacheim and roll up the Allied posi-

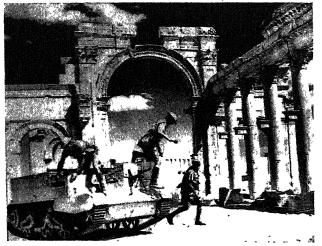

Basra was delayed by floods and demolitions.

On May 18 a mechanized column consisting of British cavalry and the Arab legion of the emir of Trans-Jordan, reached Habbaniya after marching about 560 mi. from Haifa. mostly across desert. This force secured Falluja bridge on May 19 and continued its advance, reaching the outskirts of Baghdad on May 30. The government of Rashid Ali, disheartened by the lack of adequate support from the Germans, thereupon fled the country. Resistance ceased and the regent was able to return and form a new government.

2. Syria.-During May 1941 the French (Vichy) had assisted the passage of German air forces to support Rashid Ali in Iraq. After the evacuation of Crete, the strategical importance of Syria increased; if occupied by the axis, it would constitute a threat against Turkey or Egypt. The Allies decided therefore that the country could not be left open to German infiltration and should be occupied. The degree of resistance to be expected from the French (Vichy) could not be assessed, but the presence of Free French forces with the Allies was expected to have a stiffening effect. The garrison of Syria consisted of about go battalions with go tanks. The Allies had available for this operation about 15 battalions made up of British cavalry, the 7th Australian division, 5th Indian infantry brigade and Free French forces, but no tanks. On June 8 the Allies crossed the frontier in three columns. The right column (Indian and Free French Brigade), moving via Deraa on Damascus, was checked on June 10 ten miles short of that city. The centre (Australian) column captured Merjayoun on June 9, while the left column (Australian), moving up the coast, captured Tyre and forced the passage of the Litani river. Resistance to the advance stiffened thereafter, and Merjayoun was recaptured by a French counterattack. Only along the coast was slow progress maintained.

On June 21 a bold night attack by the 5th Indian brigade reached the outskirts of Damascus and captured the airfield, causing the French (Vichy) to evacuate the city. By the end of June the coastal column, supported by fire from a cruiser squadron of the royal navy, had taken Sidon and faced a strong position covering Beirut. The Allied force in the meantime had been augmented by a British infantry brigade from Egypt and farther east by forces released from the Iraq operations. The British

British Bren tank parked amid the ancient ruins of Palmyra during the Syrian campaign of June-July 1941

mechanized column turned back across the desert and took Palmyra after hard fighting, while an Indian column moved unopposed up the Euphrates valley to capture Deir ez Zor.

On June 7, the 7th Australian division on the coast launched an attack to secure Beirut and was closely supported by effective fire from the cruisers, in the face of which resistance began to crumble, causing the French (Vichy) to ask for an armistice on July 11. This armistice was signed at Acre on July 14, and Syria passed into Allied occupation.

3. Iran.—During June and July 1941, reports began to reach the Allies of axis activity in Iran and of the infiltration of Germans described as "tourists." By the end of July, German activities had increased to an extent that compromised the neutrality of the Iranian government. After previous warning, on Aug. 16 the British and soviet governments asked the government to expel all Germans. This request was answered on August 16 by an assertion on the part of the Iranian government of strict neutrality together with a denial of German subversive activities.

As a result of this unsatisfactory reply, British and soviet troops moved into Iran on Aug. 25. British columns starting from Iraq were directed in the south on Abadan and Ahwaz and farther north on Kermanshah and Hamadan, while soviet columns advanced south on Tabriz and Pahlevi. After slight initial resistance, the Iranian army ceased fighting. A fresh government was formed in Tehran, and by Sept. 2 the basis of a settlement with the Allies had been reached.

On Sept. 16 the shah abdicated in favour of his son and on the same day British and soviet troops arrived at Tehran. All axis nationals, with the exception of 80 Germans who had disappeared into the mountains, were evacuated.

G. The Balkan Campaigns (1940-41)

1. The Greek-Italian War.—The occupation of Albania by Italian forces on April 7, 1939, caused a reorientation of the defense plans of the Greek government, which hitherto in accordance with previous Balkan agreements had been considered in face of Bulgaria as a possible adversary. The distribution of troops was altered to deploy, for defensive purposes on the Albanian front, eight infantry divisions and two infantry brigades. The timing for concentration on this front was 22 days. The Greek air force comprised about 156 planes for all purposes, many of them of an obsolescent type.

In early Aug. 1940 Mussolini discussed in Rome the possibilities of an attack on Greece. The Greek light cruiser "Helly" was torpedoed by an unknown "alleged Italian" submarine on Aug. 15, the day of the Feast of the Assumption. The Greek government, on advice from Berlin, acted with caution over this incident, but the event had an important psychological effect on the whole of the Greek populace and added a religious zeal to the prosecution of the coming war against Italy.

On Oct. 12, 1940, and subsequent days Mussolini held conferences in Rome planning the attack on Greece. The date was fixed for October 28. The Italian forces taking part were on a war footing, while the Greek army had not mobilized. The main Italian thrust, consisting of two divisions and an armoured division, was directed through Epirus and was successful in forcing back Greek forces of one infantry division and one infantry brigade to the river Acheron. In the centre on the Pindus mountains, an Italian mountain division drove in initially through two Greek battalions and penetrated to the Metsovo pass but was

unable to hold the ground gained in face of counterattacks. In the northeast, in the vicinity of the Prespa lakes, two Italian divisions attacked a Greek force consisting of one infantry division and one infantry brigade with similar results.

After two weeks of fighting, the Italian invasion had been checked and held by the Greek forces, whose divisions had concentrated on their respective battlefronts and gone straight into action. The mountainous nature of the terrain, with its lack of communications, made their supply difficulties acute. Greek peasants, men, women and children from the villages adjacent to the lines, carried up ammunition and rations to the forward troops. The Greek air force, which by this time was reduced to low numbers, was reinforced by five British squadrons from the middle east.

After Nov. 14, 1940, the initiative passed to the Greek forces. On the northeast front, in a hard battle in which five divisions were engaged on each side, the Greek forces captured the town of Koritza (Corcia); on the Epirus and central fronts, the Greeks forced back the Italians toward the frontier and by Nov. 16 had retaken Konitsa. At this juncture the Greek command was faced with having to decide whether to continue the defensive in the northeast, where the greater successes had been achieved but where they were faced with very mountainous terrain and no definite objective, or to concentrate on the Epirus front for a thrust against the port of Valona. The maintenance of communications for such an operation could be assisted by using sea transport. The latter course was decided upon and resulted in the capture of Port St. Quantara and the town of Argyrocastro by Dec. 8, while on the rest of the front parallel advances were made in the course of heavy fighting through mountains. In the centre progress had been made in the Aoos valley and Premeti was captured. Further attempts to reach Valona secured the port of Chimara on Dec. 28, but further offensive was brought to a standstill by heavy snow conditions. The strength of the forces engaged at the end of the year was as follows: Italians, 16 divisions; Greeks, 11 divisions, 2 infantry brigades and one cavalry division.

In Jan. 1941, the Greek command transferred the axis of attack to the centre sector. The offensive, initially successful, came to a halt by the end of the month after the capture of Boubessi but short of Tepelini, where it encountered many divisions freshly arrived from Italy. During February the Italians were still further reinforced and between March 9 and 25 launched a counteroffensive on a narrow front between Trebesina mountain, east of Tepelini and Boubessi, employing 12 divisions. This attack was stopped with heavy losses and no appreciable gain by six Greek divisions, while spasmodic fighting flared up all along the front. The forces engaged at the end of March were: Italian, 26 divisions; Greek, 14 divisions, 2 infantry brigades and a cavalry division.

The hard fighting, combined with bitter conditions prevailing in the Pindus mountains during the winter, had taken its toll of Greek manpower in casualties from battle and frostbite. Throughout the campaign, because of the lack of communications in the mountainous country, the maintenance of front-line troops imposed a great strain on all transport resources as well as on the troops themselves, who frequently had to resort to manhandling supplies.

The Italians were better situated in this respect, as the port of Valona and the communications radiating from it were not seriously disrupted. It was this background of conditions that the Greek command had to face when, at the end of March, the Germans were ready to strike from

Bulgaria and the action of Yugoslavia was uncertain.

2. German Occupation of Rumania and Bulgaria.—
During 1940 the occupation by the U.S.S.R. of the two Rumanian provinces of Bessarabia and Bukovina in June and the Italian attack on Greece on Oct. 28 disposed of any German intention of avoiding a commitment in the Balkans.

The joining of the axis by Rumania on Nov. 23, 1940, followed shortly by the infiltration into that country of German troops, secured the oil supply from the Ploesti fields and was a preliminary to the occupation of Bulgaria and eastern Thrace.

On March 1, 1941, Bulgaria joined the axis and the following day German troops commenced to cross the river Danube. In the occupation of Bulgaria the German forces found themselves in contact with two states, Yugoslavia on the west and Turkey to the southeast, whose attitude was so far undetermined. Forces therefore had to be detailed to cover these frontiers and had to be in sufficient strength to overawe the respective governments and prevent their taking action.

The German forces which entered Bulgaria consisted of 17 divisions (including five panzer) of which 8 were intended for the operations in Grecian Thrace. Their deployment was completed within approximately a week of crossing the Danube, but the build-up of air forces and supplies necessitated a pause; the stage was thus set for carrying out the occupation of the northern Aegean coast line at the end of March.

3. German Conquest of Yugoslavia and Greece.—The attitude of the Bulgarian government to the German infiltration into Rumania, which was nearly completed by the end of Jan. 1941, left no doubt that the German armies would be granted a free passage through that country for an attack on either Turkey or Greece. The Greek armies at that time were heavily engaged in Albania, where 300,000 troops were deployed on the front between Lake Ochrid and the Adriatic.

To replace heavy casualties in the Albanian fighting, the Greek garrisons of the fortified line in eastern Macedonia covering Salonika against an attack from Bulgaria, had been heavily drawn upon. Faced with the possibility of a German attack from this direction, the Greek government on Feb. 8, 1941, asked the British government what help could be afforded to it in case of such a development. As a result it was agreed that a British force would be sent to Greece to hold a position west of Salonika, which included the Aliakmon river and the Vermion range. This force was to be augmented by the Greek garrison from Thrace and eastern Macedonia, considered strategically indefensible in view of the forces available. This plan envisaged Yugoslavia, whose attitude was in doubt, either acting as an ally or a strict neutral, to cover the northern flank. In face of the menace of a German attack from Bulgaria, the soundest strategical course would have been to withdraw the Greek armies on the Albanian front to a shorter line and thereby produce reserves which could be used as required for operations in northeast Greece. The Greek commander in chief, Gen. Alexander Papagos, however, had to discard this plan in view of the disastrous effect it might have on the morale of the Greek soldiers.

The force for holding the Aliakmon-Vermion line was altered subsequently to three Greek divisions and seven independent battalions. The eastern Macedonia defense was held by three divisions. On March 7 the first British contingent (1st armoured brigade group) began to arrive

in Athens and moved to an area west of the river Vardar, where it completed its concentration by March 21.

Meanwhile, heavy pressure was being brought to bear by the Germans on the Yugoslav government to join the Tripartite pact which, after much vacillation, was signed in Berlin on March 25. The Yugoslavs considered this agreement an intringement of their sovereignty. On March 27, a coup d'état organized by Gen. Dushan Simovitch expelled the regent and overthrew the government. A new government was formed in Belgiade but a paralysis of indecision descended on it, and several days were lost while a state of uncertainty existed as to what courses should be adopted politically or strategically. Meanwhile, the German high command had ordered an attack on Yugoslavia to be ready in eight days. The Yugoslav armies were in a semistate of mobilization, ill equipped and lacking in modern weapons, tanks, antitank and anti-aircraft guns.

On April 6 the axis attack started with heavy bombing attacks on Belgrade, while land operations took the form of thrusts inward from all round the perimeter. These thrusts were successful in dividing the Yugoslav army and eliminating it in detail. The German columns which moved through Stip were directed on Skoplje and Bitolj with the object of getting in touch with the left flank of the Italian armies in Albania and isolating the Yugoslav forces from Greece. The head of these columns reached Bitolj on April 8 and by April 9 had completed its task of cutting off the Yugoslav forces, who, by this time, were no longer capable of organized resistance. The mevitable result was that Yugoslavia passed under German domination on April 17, within 11 days of being attacked.

The German column moving via Strumica bypassed the Greek defenses in eastern Macedonia and erupted down the Vardar valley into the Salonika plain, where it came into contact with British troops on April 9.

The collapse of Yugoslav resistance and the occupation of Bitolj by German forces threatened the Anglo-Greek army in process of getting into the Aliakmon-Vermion position, as any advance down the valley running from Bitolj to Kozani would take that position in flank and reverse, the terrain offering easy movement for armoured fighting vehicles except for a gap with poor facilities for defense near Florina.

The imperial forces had meanwhile been augmented by the arrival of the New Zealand division and two-thirds of the 6th Australian division, which enabled a hastily improvised flank guard to be collected and established to watch the Florina gap. This detachment was in position by April 9 and in touch with the 20th Greek division on the Vermion range on the right, and a Greek cavalry division with one Greek infantry brigade under command detached from the Albanian front on the left, about Nymphaion.

A heavy bombing attack by the German air force on Piraeus harbour on April 7 caused considerable dislocation to the working of the port, which never regained its former capacity. From April 8 to 11, air operations were on a low scale because of bad weather.

The collapse of resistance in Yugoslavia placed the Anglo-Greek army in a difficult situation. Its flank was threatened by a force of one armoured and one infantry division from the direction of Bitolj, while on its front a German corps was west of the river Vardar and in contact. The Aliakmon-Vermion position was held too lightly for its length of front to offer protracted defense, and it was doubtful how long the detachment guarding the Florina gap could hold on in face of the superior forces opposed to it. It was decided therefore to fall back to a line running from Mount Olympus through Servia and then northward along the mountain ridge east of and parallel to the upper section of the Aliakmon river.

The German advance from Bitolj crossed the frontier on April 10 and became heavily engaged with the flank guard. A two-day battle was fought in a snowstorm in which the Germans were able to make some slight progress. While this fighting was taking place, the withdrawal from the Aliakmon-Vermion position started on the night of April 11–12 and was completed by the morning of April 13; the flank guard covered by the 1st British armoured brigade thereupon fell back on Kozani.

German panzer units moving southward through Greece in April

1941, despite heavy spring rains and muddy roads

During these three days' operations, the forecast of General Papagos as to the effect a withdrawal would have on the morale of the Greek army became manifest. His divisions had not been trained to carry out such a complicated manoeuvre as a retreat, and signs of disintegration were beginning to appear. In consequence it was decided to withdraw all forces east of the Upper Aliakmon river to its western bank.

Up to April 14, except for the heavy bombing of Kozani, the activity of the German air force was limited while the small British air force engaged German columns. With the improvement of weather conditions, the German air force came into operation again; and its attacks became continuous, widespread and intense, directed mainly on road and rail communications.

Though the Anglo-Greek army in central Macedonia still presented an intact front, the general situation was far from satisfactory. The weakness of the left of the Greek forces in the Upper Aliakmon valley and the gap between the left of the Greek cavalry division and the armies in Albania were being exploited by the Germans and would shortly become a menace. To meet this situation it became necessary to withdraw all Allied armies to a shorter line in order to retain an intact front.

On April 14, General Papagos approved the further withdrawal of the Anglo-Greek army to a line through Thermopylae to which the armies in Albania would conform. He suggested at the same time that the British forces should withdraw from Greece to save the country from

On April 15, fighting developed in the Mount Olympus area, in which Australian and New Zealand troops were engaged. The withdrawal commenced on April 17 and was largely carried out by night to avoid German air attacks. By April 20 the occupation of the new position was complete with the New Zealanders holding the famous Thermopylae pass and the 6th Australian division the Brailos pass farther inland.

On April 18 Alexander Korizis, who had succeeded Gen. John Metaxas as prime minister, committed suicide; and King George II became acting head of the government. As a result of conferences following this crisis it was decided with the full approval of the Greek king and government that the evacuation of the imperial forces was essential, and the first night for embarkation was fixed for April 28. Events in Epirus, however, caused the evacuation to be advanced four days; on April 21 the German Adolf Hitler division had reached Yannina and the local commander, without reference to the high command in Athens, had ordered the capitulation of the whole of the Greek army in Epirus. The embarkation was set therefore to commence on the night of April 24-25 and to be completed in three nights. The port of Piraeus was unusable but still remained a target for German bombing. Nine embarkation points, consisting of small ports and open beaches, were selected on the coast line between Marathon to the north, east of Athens, and Kalamati in the south of the Peloponnesus.

The rearward movement to the beaches began on the night of April 22-23 and was carried out without interference until April 24, when a German attack in force with tanks along the coast on Thermopylae was repulsed by the 6th New Zealand infantry brigade.

The royal navy with the light forces of the Mediterranean fleet carried out the embarkation and transport of troops by sea. By using fast warships for the journey to and from Crete, rigidity in the plan could be avoided and embarkation points altered to suit the tactical situation

the remaining British fighters on an airfield at Argos gave the Germans complete superiority at this time. The evacuation was completed by April 28-29, but at

on land. The movement by sea was subjected to continu-

ous attacks by the German air force by day and cost the

loss of some warships and transports. The destruction of

Nauplion and Kalamati the Germans were successful in cutting off certain detachments which could not be embarked.

The number of British commonwealth troops sent to Greece was approximately 57,660. Of these, 43,000 were taken off, but all equipment had to be jettisoned. Of those embarked, 27,000 were landed in Crete and the remainder transported to Egypt.

The inability of the Italian forces in Albania to achieve success over the Greeks, the Yugoslav coup d'état and the presence of British forces in central Macedonia forced the German high command to a commitment considerably in excess of its original concept. In all, 27 German field divisions (including 7 panzer divisions) became involved in the campaign against Greece and Yugoslavia, in terrain which precluded rapidity of movement, thereby causing difficulties when it came to extrication.

By April 21, information had reached Athens through Balkan railway sources that a comprehensive and carefully worked out railway movement of troops from southeast Bulgaria to Galicia had been dislocated by the diversion of these troops to the Greek and Yugoslav fronts. That such a concentration was contemplated could portend only that a German attack on the U.S.S.R. was imminent. It could be assessed that in the extrication of their divisions from the Balkans, the German high command lost from four to five weeks before completing their preparations for the attack on Russia, which took place on June 22. This delay, if studied in conjunction with the German attempt to take Moscow before the end of 1941 and the advent of an early winter, played no inconsiderable part in the final outcome of World War II.

4. The Conquest of Crete.—The capture of Crete became necessary to the German high command after the occupation of Greece in order to secure sea communications in the Aegean and to provide fields for air action against the middle east and Mediterranean shipping routes. Crete, a mountainous island 160 mi. long by 40 mi. broad, offered poor facilities for defense against an attack from Greece since its one lateral road, harbours and airfields were all located along its northern shore. All Allied shipping therefore had to pass through the narrow waters between either Greece or Rhodes, held by axis forces.

The imperial garrison consisted of 28,000 troops, most of whom, having been evacuated from Greece, were short of equipment and supporting weapons. The defense was disposed along the northern coast to cover the airfields of Malemi and Retimo, the port and harbour of Heraklion and the naval base at Suda bay. The German air force was in such superiority in attacking shipping and airfields that all British aircraft were withdrawn before the main operation. The main attack started with the heavy bombing of Malemi aerodrome in the northwest corner of the island at dawn on May 20 and was followed by parachutists and gliders. In the afternoon similar tactics were employed against Retimo and Heraklion. In all about 7,000 troops were landed during the day. Casualties were extremely heavy, and only at Malemi had the attack established itself. At night counterattacks by New Zealand troops were at first successful, but at dawn they were com-

pelled to abandon ground because of heavy bombing.

During May 21-22, heavy fighting took place around Malemi aerodrome while German forces were continually landing from troop carriers. This enabled a sufficient force to be built up at Malemi to advance toward the town of Canea.

During the nights May 21-22 and 22-23, German attempts to reinforce by sea, using a large number of small craft, were frustrated by the royal navy, which caused considerable casualties but at the same time suffered losses itself from bombing after daylight.

Heavy fighting continued through May 24–25, the German attacks on Canea continuing to make progress; at Heraklion two British battalions landed on the south coast, marched overland and eased the pressure. German detachments, however, isolated the Retimo garrison by cutting the road east and west of the airfield.

On May 27, the Germans succeeded in breaking through the Allied defenses covering Canea and thereby rendered Suda bay untenable. The continuous fighting and uninterrupted air bombing were beginning to exhaust the power of the defense with the result that on that day the decision was made to evacuate. The losses suffered by the royal navy from axis bombing made it imperative that the evacuation should take place in the shortest possible time and it was decided that all should be completed by the night of May 31-June 1. The imperial forces in the Canea area, consisting of Australian and New Zealand brigades, British marines and commandos with tank and artillery units, withdrew over the mountains to the small port of Sphakia on the south coast, where embarkation started on the night of May 28-29 and was carried out without undue interference. At Heraklion the evacuation was completed on the night of May 28-29 from that port in warships, thereby avoiding a German attack which was in prepara tion. The isolated Australian and Greek garrison at Retimo, having received no orders to withdraw, continued fighting until May 31, when it was overwhelmed.

There were 27,550 imperial troops in action at the commencement of the attack; of these, 14,580 were evacuated. The German losses were estimated at between 12,000 and 15,000, which included a very high percentage of killed.

The German success was attributable to the manner in which a completely superior air force was handled in conjunction with air-borne troops. Success against troops ill supplied with supporting arms took longer to achieve and cost more than the German high command anticipated. The troops employed could not be reconstituted before late in the autumn, and an operation on such a scale was never again attempted. (H. M. WN)

H. The German-Russian War

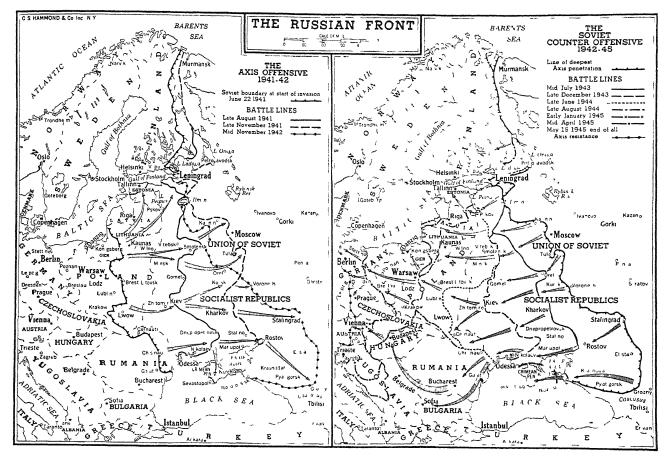

The course of history was changed when Hitler invaded the U.S.S.R. on June 22, 1941, a day ahead of the anniversary of Napoleon's invasion. That move ultimately proved as fatal for him as it had for Napoleon. The effect was most immediate on Britain's situation. Until then its prospects had appeared hopeless in the eyes of most people except its own, for its situation was far worse under modern conditions of war than it had been in Napoleon's time. Its government's decision to continue the struggle after the fall of France, and reject Hitler's peace offers, could spell only slow suicide unless relief came from one or other of the two remaining great powers. Otherwise, even if a German sea-borne invasion failed, the concentrated develop-

ment of submarine and air pressure on Britain's sea communications was bound to produce eventual collapse.

Hitler brought Britain relief by turning east, just as the strain was becoming severe. That eastward turn was influenced by Britain's stubborn resistance but had deeper promptings. He had always contemplated the overthrow of soviet Russia. Though he had brought himself to make the 1939 pact as a matter of expediency, anti-Bolshevism was his most profound emotional conviction, arising from fear even more than from ambition. It had been stirred up afresh before he even considered the question of invading Britain. For early in June 1940, while he was still engaged in the French campaign, Stalin had seized the opportunity to occupy the three Baltic states. Then on June 26, again without notice to Hitler, Russia addressed a 24-hour ultimatum to Rumania demanding the restoration of Bessarabia, together with the surrender of northern Bukovina. The Russian forces poured in immediately, as Rumania yielded. That placed them ominously close to the oilfields on which Germany depended. Hitler became acutely suspicious of Stalin's intentions and began to feel that he could not afford to wait to complete the subjugation of the west before dealing with Russia.

A provisional plan for a stroke against Russia was worked out in the late summer of 1940, and elaborated in the autumn. The doubts of his generals merely served to give the new turn of his mind a more definite bent. Their doubts suggested that they still distrusted his military judgment; he must prove them wrong once again, and more strikingly. When they argued that it meant war on two fronts, he retorted that to overcome Britain would require an expansion of the air force and navy at the expense of the army, and that this could not be risked while Russia remained a menace. In that mood he did not share his diplomatists' moderate satisfaction over the result of the November discussions with Vyacheslav Molotov in Berlin, but only noted the Russians' hesitation to join the axis. On Dec. 18 he issued "Directive No. 21, Case Barbarossa," which opened with the statement: "The German armed forces must be prepared to crush soviet Russia in a quick campaign before the end of the war against England."

On Feb. 3, 1941, Hitler approved the final draft of the plan, and had it expounded by Field Marshal Wilhelm Keitel to a conference of his chief soldiers. Their anxieties were not diminished by Keitel's balance sheet, which showed that the invasion would have to be made with an inferiority of numbers, in tanks as well as men, and must trust to an offsetting superiority of quality. That deficiency of strength became a handicap even before the offensive was launched. For Hitler was anxious to safeguard his Balkan flanks before striking at Russia and had hoped to secure this by power-diplomacy alone, without fighting. That hope was impaired, to his annoyance, by Mussolini's independent aggression against Greece which opened up the prospect of a British army's being landed there. This threat led Hitler to decide that he must overcome Greece and clear out the British before he could proceed with his eastern plan. But the effort entailed was much increased when Yugoslavia's adhesion to the axis was upset by a military coup d'état in that country on March 27. Larger forces had now to be sent south to crush Yugoslavia simultaneously with Greece. Both nations were quickly overrun while the British were hustled back into their ships. But Hitler's decision, on April 1, to mount this double offensive had entailed the postponement of the Barbarossa plan from the middle of May to late June. By the swiftness of his Balkan victories he was able to keep to this revised timetable, but the five weeks' delay went far toward for-

feiting his subsequent chance of victory over Russia.

1. To the Outskirts of Moscow.—The German offensive was delivered on June 22, 1941, by three army groups under the same commanders as in the 1940 invasion of the west. Field Marshal Gerd Rundstedt was on the right, in southern Poland. Field Marshal Fedor von Bock was in the centre, north of the Pripet marshes. Field Marshal Wilhelm von Leeb was on the left and drove through the Baltic states. But this time the main weight, and the decisive role, was committed to Bock's army group. Two armoured groups (later rechristened "armies"), under Gen. Heinz Guderian and Gen. Hermann Hoth, were allotted to Bock's front compared with only one, under Kleist, to Rundstedt's front. Once again the issue turned, not on the infantry masses, but on the armoured forces. These had now been increased from 10 divisions to 20, but only by halving the scale of tanks in each division.

On Bock's front, the invasion profited at the start from the way that the Russian position in Poland formed a projection. Cutting quickly into the flanks of this Bialystok salient, Bock's armies attempted their first pincer stroke around Slonim, 100 mi. beyond the initial front line. But they were not quick enough to complete the encirclement before the bulk of the enveloped Russian armies forced their way out of the trap. Although these were clumsily handled and frittered their tank strength away in piecemeal action like that of the French in 1940, the isolated troops fought with a stubbornness that the French had not shown, and their resistance imposed a brake by the way it continued to block road centres long after the German tide had swept on.

The armoured groups of Guderian and Hoth, on the wings, now drove 100 mi. farther to produce an envelopment round Minak, which fell on June 30. But the effort

to close the ring failed, though many prisoners were taken, and with the miscarriage of this intended decisive manoeuvre, Hitler's dream of a quick victory faded. A series of rainstorms came to the aid of the Russians, turning the sandy soil into mud. Even when the tanks could push on, they were often held back because their transport, composed of heavy-wheeled vehicles, was bogged. The Germans had owed their success to the measure in which they were mechanized but now paid forfeit for not being sufficiently mechanized, that is, on tracks. The frustration of Hitler's "grand design" now drew him into that advance beyond the Dnieper which he had hoped to avoid. In mid-July a third encirclement was executed around Smolensk. This time a much larger bag of Russians was secured but more escaped to help in forming a fresh block across the road to Moscow. The Germans were now 400 mi. deep into Russia, and Moscow lay 200 mi. ahead. Bock wanted to oush on, but Hitler hesitated in a state of indecision.

Meanwhile, Rundstedt's army group had been driving forward through southern Poland with little difficulty despite the greater strength of the Russian armies there. These were thrown off their balance by the invasion and fell back eastward in confusion. In the next phase, Rundstedt's advance was delayed by flank counterattacks from the Pripet marshes. But at the end of July, Kleist's tanks broke through Gen. (later Marshal) Simeon M. Budenny's front south of Kiev and made a scythe-like sweep down through the Ukraine toward the Black sea. The mouths of the Bug and the Dnieper were reached by mid-August, trapping a large part of the southern Russian armies which were opposing the advance from Rumania. This striking success suggested to Hitler the idea of shifting his centre of gravity and carrying out another great encircling manoeuvre near the junction of Bock's and Rundstedt's army

groups. Kleist was ordered to wheel northward again, and Guderian southward, to close the pincers behind the Russian armies assembled around Kiev. This trap succeeded, and 600,000 prisoners were taken. But it was late in September before the victory was completed, and winter was approaching.

Elated by this great success, Hitler decided to resume the advance on Moscow, while Kleist was again sent south, to form the spearhead of a continued advance southeastward by Rundstedt, from the Dnieper to the Don, on the road to the Caucasus. Leeb's advance through the Baltic states had reached the outskirts of Leningrad, but Hitler cancelled the intended assault, fearing to become entangled in city fighting. Rightly, he deemed it wiser to rely on the German superiority of manoeuvre in the open, but he had lost the best two months of the summer, when the open country was good going. He also handicapped his chances by splitting his effort in divergent directions.

The renewed advance on Moscow began on Oct. 2. Its prospects looked bright when Bock's armies brought off a great encirclement round Vyazma, where a further 600,000 Russians were captured. That left the Germans momentarily with an almost clear path to Moscow. But the Vyazma battle had not been completed until the end of October; the German troops were tired, the country became a morass as the weather got worse, and fresh Russian forces appeared in the path as they plodded slowly forward. Most of the German generals wanted to break off the offensive and take up a suitable winter line. But Hitler could not resist the temptation of Moscow, now so close in front of his eyes, and was convinced that the Russians were on the verge of collapse. Bock, as the commander who was given the role of honour, had a natural tendency to agree with Hitler. On Dec. 2 a further effort was launched, and some detachments penetrated into the suburbs of Moscow; but the advance as a whole was held up in the forests covering the capital.

2. Russian Winter Counteroffensive.—This was the signal for a Russian counteroffensive of large scale, prepared and directed by Gen. (later Marshal) Georgi K. Zhukov. It tumbled back the exhausted Germans, lapped round their flanks and produced a critical situation. From generals' downward, the invaders were filled with ghastly thoughts of Napoleon's retreat from Moscow. In that emergency Hitler forbade any retreat beyond the shortest possible local withdrawals. His decision exposed his troops to awful sufferings in their advanced positions facing Moscow, for they had neither the clothing nor equipment for a Russian winter campaign; but if they had once started a general retreat it might easily have degenerated into a panic-stricken rout.

In the south, Kleist's drive had reached Rostov, near the mouth of the Don, on Nov. 23; but it had exhausted its fuel in plowing through the mud. The glamour of attaining this "gateway to the Caucasus" impelled Hitler to insist on staying there, although Rundstedt tendered his resignation rather than commit such a folly. Within a week the Germans were thrown back by a Russian counterstroke there. For a moment their situation looked grave, but they managed to hold on to the defensive line of the Mius river, which Rundstedt had chosen before his removal.

The soviet army's winter counteroffensive continued for more than three months after its December launching, though with diminishing progress. By March 1942 it had advanced more than 150 mi. in some sectors. But the

Germans maintained their hold on the main bastions of their winter front-such towns as Schlüsselburg, Novgorod, Rzhev, Vyazma, Briansk, Orel, Kursk, Kharkov and Taganrog-despite the fact that the Russians were often many miles in the rear. In retrospect, it became clear that Hitler's veto on any extensive withdrawal worked out in such a way as to restore the confidence of the German troops and probably saved them from a widespread collapse. Nevertheless, they paid a heavy price indirectly for that rigid defense. Its success encouraged the belief that it could be as successfully repeated in the more adverse conditions of the following winters. A more immediate handicap was that the strength of the luftwaffe was drained in the prolonged effort to maintain supplies by air, under winter conditions, to the garrisons of these more or less isolated bastion towns. The tremendous strain of that winter campaign, on an army that had not been prepared for it, had also a serious delayed effect in other ways. Before the winter ended, many divisions were reduced to barely a third of their original strength. They were never fully built up again. The unfavourable aspects of the situation were realized by the German general staff, but its heads now had less power to influence Hitler's decision. Hitler's pressure was too strong for them to resist, and the pressure of events was too strong for Hitler. He was compelled to go on and on. The weight of military opposition was weakened by the changes in the higher commands which followed the miscarriage of the 1941 campaign. When the failure of the whole campaign was plain to the world, the removal of Field Marshal Walther von Brauchitsch was announced. That act served the dual purpose of furnishing Hitler with a scapegoat and opening the way for him to take over direct command of the army.

3. German Advance to the Caucasus.—The plan to launch another great offensive crystallized in the early months of 1942. Hitler's decision was influenced by pressure from his economists. They told him that Germany could not continue the war unless it obtained oil supplies from the Caucasus, a view that was proved mistaken by the fact that Germany failed to secure the Caucasus oil yet managed to continue the war for three more years. But Hitler was the more responsive to such economic arguments because they coincided with his instinctive urge to do something positive and offensive. He was led, however, to recognize the limitation of Germany's resources to the extent of admitting the necessity of limiting the scope of his new offensive. The main effort was to be made on the southern flank near the Black sea.

The most effective factor in clearing the path for the German advance was a Russian offensive toward Kharkov, which began on May 12. This was a premature effort, beyond the powers of the soviet army at this stage in face of the Germans' defensive skill. The prolongation of this Kharkov offensive played into the Germans' hands, absorbing too large a part of the Russians' reserves. Moreover, although the Russians succeeded in parrying the immediate counterstroke which the Germans launched against the southern flank, this gained a valuable leverage for the future by reaching the Donetz river near Izyum. On June 3, preliminary to the main offensive, a siege assault was launched against the fortress of Sevastopol though it was not until July 3 that the fortress, and with it the whole Crimea, was completely in German hands. On June 10 the Germans exploited their Izyum wedge by forcing the passage of the Donetz and gaining a bridgehead on the north bank. This created an invaluable flanking leverage to assist the easterly thrust of their main offensive, which was launched on June 28.

The 4th panzer army broke through in the sector between Kursk and Byelgorod, and swept rapidly across the 100-mi. stretch of plain to the Don near Voronezh. It then wheeled southeastward into the corridor between the Don and the Donetz, followed by the 6th army, which had the mission of taking Stalingrad. These operations tended to cloak the menace that was developing on the right wing. For a more dangerous thrust was being delivered by Kleist's 1st panzer army from the Kharkov sector. After achieving a quick break through, it drove toward the lower Don at and above Rostov. There it gained a crossing, with little opposition, on July 22, after an advance of about 250 mi. from the starting line. The German armies now forked on divergent courses: part for the Caucasus oil fields, and part for the Volga at Stalingrad. After crossing the lower Don, Kleist's right column drove southward through Armavir to the great oil centre of Maikop, 200 mi. beyond Rostov, which it reached on Aug. 9. On the same day the van of his centre column swept into Pyatigorsk, 150 mi. to the east of Maikop, on the outskirts of the Caucasus mountains.

The pace of this early August onrush beyond the Don was terrific. But it slowed down almost as suddenly as it had developed. The prime causes were a shortage of fuel and an abundance of mountains. That dual brake was subsequently reinforced by the distant effect of the struggle for Stalingrad, which drained off a large part of the forces that might have been used to give a decisive impetus to the Caucasus advance. The first serious check occurred on reaching the Terek river, which covered the approaches to the mountain road over to Tiflis. Kleist then tried a manoeuvre to the east, downstream, and succeeded in forcing a passage near Mozdok, in the first week of September. But his forces were held up again in the densely wooded hills beyond the Terek. Throughout September and October, Kleist went on trying to push south from Mozdok, by surprise attacks at different points. At each attempt he was blocked. The front was then stabilized, with the Germans still facing the mountain barrier which they had vainly tried to pierce. This final repulse in the central Caucasus coincided with the opening of the great Russian counteroffensive at Stalingrad.

4. Turning Point at Stalingrad.—The German command might have captured Stalingrad with little difficulty at the end of July if it had not overestimated the capacity of the Russians to hold Rostov and the lower Don. For the 4th panzer army was temporarily diverted southward to help the 1st, which, in fact, needed no such help. When the postponed thrust to Stalingrad developed a fortnight later, the Russians had gathered just sufficient forces to check the advance. Another fortnight passed before their resistance was loosened by the advance of the German 6th army, under Gen. (later Field Marshal) Friedrich Paulus, eastward across the Don bend. The last week of August had thus arrived before the Germans were ready to begin the final stage. The tenseness of the situation was manifested in the tone of the call of the Russian troops to hold on at all costs to the last man. They responded to the call with wonderful endurance. Attack followed attack in seemingly endless succession, with frequent changes of site and method, but with only slight progress to compensate for the attackers' cost. The more closely the Germans converged on the city, the more their own power of manoeuvre became cramped, whereas the narrowing of the frontage helped the defender in moving his reserves more quickly to a threatened point on the diminished arc. At the same time, the Germans' concentration at Stalingrad increasingly drained reserves from their flank cover, which

The German caption on this photograph showing nazi soldiers in Stalingrad during the siege of 1942 noted that "one step at a time, every foot of ground in Stalingrad had to be fought for"

itself was already strained by having to stretch so far, nearly 400 mi. from Voronezh along the Don to the Stalingrad "isthmus," and as far again from there to the Terek.

On the surface, the defenders' position came to appear increasingly perilous, or even desperate, as the circle contracted and the Germans came closer to the heart of the city. The most critical moment was on Oct. 14. The detenders now had their backs so close to the Volga that they had little room left in which to practice shock-absorbing tactics. But beneath the surface fundamental factors were working in their favour. The attackers' morale was being sapped by heavy losses, a growing sense of frustration, and the coming of winter, while their reserves were so fully absorbed as to leave the overstretched flanks without resiliency. They were thus becoming ripe for the counterstroke which the Russian command was preparing. It was launched on Nov. 19 and was well timed. It started in the interval between the first strong frosts, which hardened the ground for rapid movement, and the heavy snows, which clogged manoeuvre. A pair of pincers, each composed of several prongs, was inserted in the flanks of the Stalingrad attack, so as to isolate the 6th army and 4th panzer army. The pincers were driven in at places where the flank cover was largely provided by Rumanian troops. The plan was devised by a brilliant triumvirate of the Russian general staff, Zhukov, Gen. (later Marshal) Alexander M. Vasilevsky and Gen. (later Marshal) Nikolai N. Voronov. By Nov. 23 the encirclement was completed. It was welded more firmly in the days that followed, enclosing more than 200,000 Germans.

Meanwhile, another powerful Russian force had burst out of the Serafimovichi bridgehead and spread over the

country west of the Don bend. This outer-circle movement was of vital importance, for it dropped an iron curtain across the more direct routes by which the relieving forces might have come to the aid of Paulus. Thus, the German reply, in mid-December, was delivered from the southwest, beyond the Don, up the line from Kotelnikovo to Stalingrad. But this hastily improvised advance was checked a long way short of the beleagured army and then gradually forced back by Russian pressure on its own flank. With the frustration of this attempt any hope of relieving Paulus passed, for the German command had no reserves for another attempt.

Hitler was at last brought to realize the inevitability of a disaster greater even than the Stalingrad encirclement if he persisted in his dream of conquering the Caucasus and compelled the armies there to cling on while their flank was exposed for 600 mi. back. So, early in Jan. 1943, the order was sent that they were to retreat. The decision was taken just in time for them to escape being cut off. Their successful extrication prolonged the war, but it preceded the actual surrender of the Stalingrad armies in making clear to the world that the German tide was on the ebb. Paulus' army at Stalingrad surrendered on Jan. 31, 1943, at the same time as Kleist's army from the Caucasus recrossed the Don at Rostov. The latter could hardly have escaped if Paulus' army had yielded any time during the first seven weeks after its encirclement. Its sacrifice detained Russian forces that could otherwise have poured down upon Kleist's line of retreat and swamped Field Marshal Fritz Erich von Manstein's army which was covering Kleist's rear. Even as it was, those two armies held off the Russians' outflanking pressure by the narrowest of margins. In terms of time, space, force and weather conditions that Xenophon-like retreat was an amazing performance.

5. Russian Reconquest of the Ukraine.—After Kleist's army had passed safely through the Rostov bottleneck, it had still to ward off dangers that were developing farther back on its line of retreat. In the last half of Jan. 1943 Gen. Nikolai F. Vatutin's armies had struck southward

Red army troops in Kharkov after its first capture by Russian troops Feb. 16, 1943. The city was retaken by the Germans a month later, but occupied again by the Russians the following Aug. 23

from the middle Don to the Donetz. At the same time Gen. Filip I. Golikov's armies, farther west, broke through the front of the 2nd Hungarian army, and within a week drove forward 100 mi., halfway from the Don to Kharkov. Before the end of the month the Russians struck westward from Voronezh, across the upper Don, and advanced on Kursk, the starting point of the last German summer offensive, which they captured on Feb. 7. Two days earlier Vatutin had crossed the Donetz southward at Izyum and then spread westward to capture Lozovaya junction on Feb. 11. Besides undercutting the German position at Kharkov, which fell into the Russians' hands on Feb. 16, these advances came near to intercepting the armies of Manstein and Kleist. Their retreat became a race, with the odds against them.

But a dramatic change came over the scene in the last half of February. An early thaw intervened to hamper the Russians in bringing up supplies and reinforcements to maintain their momentum. Thus, the retreating armies gained time to get back to the Dnieper, with the help of the better communications in the coastal strip, and mount a counteroffensive just as the Russian advance had lost its impetus. This counteroffensive snapped off the Russian wedges southwest of Kharkov and recovered the line of the Donetz. If the Germans could have crossed the river quickly and cut astride the rear of the soviet armies that were pushing westward, they might have produced a Russian disaster comparable to their own at Stalingrad. But they were baulked in the attempt, lacking the strength to storm such a barrier. Although they squeezed the Russians out of Kharkov, their own drive petered out in the slush of the spring thaw.

Further evidence of their shrinking strength was seen in the withdrawal they were now compelled to carry out in the north. Gen. Kurt Zeitzler, who had succeeded Gen. Franz Halder as chief of the general staff, persuaded Hitler that it was no longer possible to maintain their advanced position facing Moscow. So in March the Germans abandoned their salients there and fell back to a straighter line close to Smolensk. What the Germans gained by this shortening of their front was, however, more than offset by the fresh extension caused by the success of their counteroffensive in the south. Although its results had been limited, it had secured a promising set of offensive springboards that looked all too tempting to a leader who instinctively clung to the hope that an offensive success in summer might still turn the war in his favour. By recapturing Byelgorod and retaining Orel the Germans had suitable flank positions for a pincer stroke against the big salient in which the Russians were left around Kursk.

Following this line of thought, Hitler concentrated all efforts on that offensive without regard to the risk that the cost of an unsuccessful attack would leave him without reserves to maintain any subsequent defense of his long front. His generals had become more doubtful than ever of his policy, though the two who were chosen to play the leading roles, Kluge and Manstein, naturally tended to swallow their doubts—professional opportunity always nourishes hope. But the increasing difficulty in building up the forces, with fresh drafts of men and equipment, was reflected in the increased delay that year in opening the summer offensive. Three months' pause followed the close of the winter campaign.

By contrast, the soviet army had improved a lot since 1942, both in quality and quantity. The flow of new equipment had greatly increased as well as the number of new divisions, and its numerical superiority was now about four to one. Better still, its leadership had improved with

experience. Generals and junior commanders alike had become more skilled tacticians. That was foreshadowed in the way the Russians, in the summer of 1943, waited to let the Germans lead off and commit themselves deeply, while they themselves kept well poised to exploit the Germans' loss of balance in lunging.

The German offensive was at last launched on July 5, and into it Hitler threw 17 armoured divisions, almost all he had. Both the pincers got entangled in the deep mine fields which the Russians had laid, forewarned by the long preparation of the offensive, and failed to secure any large bag of prisoners since the Russians had withdrawn their main forces out of reach. After a week of effort the German armoured divisions were seriously reduced.

On July 12, as the Germans began to pull out, the Russians launched their own offensive, which thus had the recoil-spring effect of a counterstroke. The Germans just managed to check the northern thrust from cutting their communications behind Orel, and they were not squeezed out of that city until Aug. 5. The southern thrust began more gradually but then quickened into a deep drive past Byelgorod. The danger of a general collapse was narrowly averted by the arrival from the south of the Germans' one remaining armoured corps, though Kharkov had to be abandoned. In the second half of August the Russian offensive was more widely extended; and though it did not make headway very fast, its alternating strokes kept the scanty German reserves scurrying from sector to sector.

In September the shrinkage of German reserves was reflected in an acceleration of the Russians' advance. Skilful commanders like Vatutin, Gen. (later Marshal) Ivan S. Koniev and Gen. (later Marshal) Konstantin Rokossovski were quick to exploit thin stretches of the broad front. Before the end of the month they had reached the Dnieper and established a wide range of bridgeheads beyond it. While attention was focussed by Vatutin's threat to the famous city of Kiev, Koniev burst out of his bridgehead at Kremenchug and went halfway to severing the great bulge formed by the Dnieper bend. Although Manstein rushed reserves there in time to stem the advance and extricate the imperilled garrisons, it was at the price of a breakdown between the Dnieper bend and the sea. The Russians' fresh stroke there reached the mouth of the Dnieper early in November, closing the exits from the Crimea and isolating the German forces there.

At the same moment Vatutin advanced from his bridge-heads near Kiev, broke into the city from the rear and drove 100 mi. westward in a week to capture the junctions of Zhitomir and Korosten, not far from the Polish frontier. Manstein was left without reserves to meet this crisis, but ordered one of his best young generals, H. von Manteuffel, to scrape together such armoured fragments as he could find for a flank counterattack. This light stroke profited by the Russians' overstretch and tumbled them out of both junctions. Manstein tried to develop the opportunity by organizing a larger counter-offensive when reinforcements arrived from the west; but although it pushed the Russians back toward Kiev it was never so dangerous as it appeared on the surface, and early in December it petered out in the mud.

Hitler's chief consolation that autumn was that his northern armies, after falling back from Smolensk in September to a line covering the upper Dnieper, succeeded in repelling five successive Russian offensives between October and December. The assaults there were mainly delivered astride the Moscow-Minsk highway. As they

came along an obvious line and on a narrow front, the well-knit defense proved superior despite a numerical inferiority of about one to six. It showed how Hitler might have spun out the war if his strategy had been wiser, and less self-exhausting.

6. Russians Enter Poland and Rumania.—The dominant factor in the campaign of 1944 was that the German front remained as wide as ever, while the German forces were shrinking. As a natural result the Russian advance continued with little check except from its own supply problem; and, because of the Russians' simpler requirements, that problem was less of a handicap than in any other great national army. On Dec. 24, 1943, Vatutin's armies, now reinforced, burst out of the Kiev salient and within a week had regained Zhitomir and Korosten. On Jan. 4 they crossed the prewar Polish frontier. Scraping up reserves, Manstein produced another inner flank counterstroke that checked Vatutin's progress, but only at the price of thinning the line both north and south. The Russians soon profited by the opportunity. On the north, they drove forward and captured Luck, 100 mi. beyond the frontier, by Feb. 5. On the south, Vatutin's left wing converged with Koniev's right wing to pinch off a force of ten weak German divisions that was still clinging, by Hitler's order, to the Dnieper line near Korsun. This produced a miniature "Stalingrad." The effort to bring help to this trapped force entailed, in turn, the abandonment of Nikopol, in the Dnieper bend, and its valuable manganese ore.

Early in March 1944 the Russians started a new combined manoeuvre, of still wider scope. It began with a thrust toward Tarnopol that outflanked the defensive line of the upper Bug. This was delivered by Zhukov, who had taken charge of Vatutin's armies when the latter was stricken with a fatal illness. Meanwhile, at the southern end of the front, Gen. (later Marshal) Rodion Y. Malinovski's armies pushed forward across the mouths of the Dnieper and the Bug. Between these two horns, Koniev drove suddenly forward to the central stretch of the Bug, crossed it, drove on to the Dniester 70 mi. beyond and crossed this difficult river by seizing pontoon bridges intact in the confusion caused by his swift onrush.

Before the end of March, Koniev's spearheads had penetrated to the line of the Pruth near Jassy, in Rumania, while Zhukov had crossed the upper reaches of that river. This advance brought them close to the foothills of the Carpathians, the ramparts of Hungary. Hitler promptly reacted to the danger by occupying Hungary. The preservation of this mountain barrier was essential, not only to check a Russian surge into the plains of central Europe, but to ensure any continued hold on the Balkans.

On April 1 Zhukov's advance reached the entrance to the Tartar pass, and it looked as if he might repeat Sabutai's exploit of 1241, when the Mongols swept through the Hungarian plain to the Danube in a few days. But his spearhead failed to penetrate the pass, and there was not sufficient weight behind it to renew the impetus. His forces were feeling the effects of their prolonged advance, while the Germans benefited by falling back on their supply lines. The following week they succeeded in mounting a flank counterstroke from the Lwów area that broke off the tip of Zhukov's spearhead and enabled them to extricate a part of their forces which had been trapped by the Russians' rapid advance. After this the front in southern Poland was stabilized from April to July. Koniev, also, was halted in his effort to penetrate the northern

stretch of the Rumanian frontier. But his left wing wheeled south down the Dniester, toward the Black sea, thus threatening the rear of the German forces that were facing Malinovski's advance toward Odessa. This leverage squeezed the Germans out of that great port, which was regained by the Russians on April 10.

April also saw the liberation of the Crimea, to which Hitler had insisted on clinging. Gen. (later Marshal) Fedor Tolbukhin attacked southward, from the mainland, and unhinged the defenses of the Perekop isthmus by a crossing of the Siwash Iagoon. Then Gen. Andrey Yeremenko struck westward from his foothold on the Kerch peninsula. The Germans were thrown into confusion, and most of the Crimea forces were quickly overrun, up to the outskirts of Sevastopol. Hitler still believed that the fortress itself could be maintained, though he let the Rumanians be evacuated by sea and relied on the stubbornness of the German garrison. But when the Russians breached the southeast approaches, between Inkerman and Balaklava, the garrison abandoned Sevastopol on April 10 and fell back into the Khersonese peninsula. The Germans' resistance there, with their backs to the sea, was as brief as on the Cape Bon peninsula in Tunisia the year before.

On the other flank of the eastern front, a January offensive broke the Germans' encircling grip on Leningrad. There, however, they achieved an orderly withdrawal, at the end of which they stood fast on the line of lakes from the Gulf of Finland to Pskov. This straightening and shortening of their front much improved their situation for the moment. But it left the Finns in isolation and prompted them to approach the Russians for an armistice in February. Although the Finns baulked at accepting the Russian conditions and did so again after the renewed negotiations that followed a Russian advance to Viipuri in June, it was only a postponed capitulation. Moreover, Finland's attempted breakaway set an example that Germany's other satellites soon followed. The general stabilization of the eastern front that the Germans apparently achieved in May 1944 was unstable, both politically and militarily, under the surface.

7. The Russians on the Vistula.—The Russians' main summer offensive was launched two and a half weeks after the Anglo-U.S. invasion of Normandy. Contrary to general expectation the offensive began, not from the Russians' great wedge in southern Poland, but from their relatively backward line north of the Pripet marshes, in White Russia. This was the best-fortified sector of the German front and had withstood repeated assaults in 1943; but for that very reason it was less likely to be reinforced, now that the German reserves were so scanty. Moreover, the German communications there were long stretched and suffered much interference from the Russian partisans, whereas the Russian communications were shorter there than in the south, so that their offensive could have greater momentum. Four groups of armies were massed there for the Russian offensive. Realizing the danger, the German commanders wanted to carry out a withdrawal before the blow fell, to the line of the Berezina, which would have thrown the Russian advance out of gear; but Hitler forbade it.

The offensive opened on June 23, 1944. Exploiting wedges driven in the previous autumn, the right wing began by pinching out the famous bastion town of Vitebsk and then swung south across the highway from Moscow to Minsk. On the other flank Rokossovski's armies broke through just north of the Pripet marshes and then drove

150 mi. deep, in a week, to cut the highway farther back on the stretch from Minsk to Warsaw. Minsk itself fell on July 3. Although a large part of the enveloped armies managed to find a way back by secondary routes, the Russian mechanized spearheads raced ahead, bypassing any attempted blocks. By mid-July they had overrun half of northeast Poland and pressed deep into Lithuania.

On July 14 the Russian armies south of the Pripet marshes joined in the offensive; and within a fortnight were across the San, besides capturing Lwów. This multiple pressure at so many points gave Rokossovski's mobile columns an opening to slip through the centre, past the end of the marshes, and reach the Vistula. On July 31 one of them penetrated to the suburbs of Warsaw, and the Polish underground leaders there were encouraged to give the signal for a rising.

It was a moment of general crisis for the Germans. In the west their front in Normandy was collapsing, while their rear was shaken by the repercussions of the plot to kill Hitler and the purge that followed. But an astonishing rally came in August, beginning at Warsaw. Three Schustztaffel armoured divisions arrived at the crucial moment and delivered a counterstroke which threw back the Russian advanced forces. This gave the Germans a breathing space in which to suppress the Polish rising. But the change was not confined to that sector, for by the end of the first week of August the Russians were held up almost everywhere. They had advanced up to 450 mi. in 5 weeks-the longest and fastest advance they had yet achieved. They were now suffering the natural effect of overstretching their communications and had to bow to that strategic law. Six months were to pass on the Vistula before they were ready to mount a fresh drive.

8. The Hungarian Plain Reached.—The reprieve which Hitler obtained on the main front, however, was offset by the advent of a fresh menace on his Balkan flank. On Aug. 20, 1944, Malinovski and Tolbukhin launched a converging attack on the German salient that still projected into Bessarabia. Aug. 23 saw a change of government in Rumania, which thereupon made peace and simultaneously changed sides as a sequel to negotiations that had been proceeding for some time. With their passage thus cleared, the Russians pushed through the mountain barrier into Transylvania and, more quickly, up the Danube valley to the Yugoslav frontier. At the same time they occupied Bulgaria, where they met no resistance.

The autumn of 1944 saw the gradual development of a great wheel, by the Russian left wing, through the vast spaces of southeastern and central Europe. All that the Germans could do was to put a brake on it, by holding the successive communication centres as long as possible, and gain time to extricate their forces from Greece and Yugoslavia. Belgrade was liberated on Oct. 20. Meanwhile, the inner flank of the wheel had reached the edge of the Hungarian plain. From there the Russians made a strong spurt, which reached the suburbs of Budapest on Nov. 4. But, like other cities that had been stubbornly defended, Budapest proved a hard nut to crack. It was still unconquered at the end of the year, though by then deeply enveloped, and did not fall until Feb. 13, 1945.

The autumn of 1944 also saw a similar flank-sweeping process at the northern end of the eastern front. Finland capitulated early in September, and the Russians then concentrated on clearing the Baltic states and, if possible, cutting off the German army group which still clung there. Although it managed to evade several dangerous scythe strokes, the remains of it were cornered, by mid-October, in the Courland peninsula. The Russians then tried to

break into East Prussia, but their attacks there were repelled and deadlock ensued.

The year 1944 had seen a tremendous shrinkage in Germany's lebensraum. Yet it had avoided the total collapse that seemed almost certain at the end of the summer. Its subsequent rally—in the east, and the west and the centre of Europe—was proof of the combined effect of its contracted defensive front and the attackers' extended communications. It also showed how the Allies' demand for "unconditional surrender" had helped Hitler to stiffen the Germans' resistance. That might have continued longer, gaining time for the development of his new weapons, if he had planned a strategy of elastic defense, instead of insisting on the rigid defense of untenable positions.

9. From the Vistula to the Oder.—The year 1945 opened with a German counteroffensive to relieve Budapest. This did not succeed in its local aim, and it was made with armoured divisions that had formed the main reserve available to meet a renewed Russian offensive in Poland. Yet Hitler, while dictating this abortive effort in Hungary, would not permit any withdrawal from the Vistula line, to forestall the expected Russian offensive there. He thus, in a double way, played into the hands of Stalin.

After nearly six months' interval for preparation, the Russians had built up their communications in Poland and assembled abundant resources for a long drive. Besides a numerical superiority of nearly five to one, they had greatly increased the output of their new "Stalin" tanks, which the Germans considered the best in the world, while the inflowing stream of U.S. trucks enabled them to motorize many more of their infantry brigades, to back up the armoured thrust.

The offensive was initiated on Jan. 12, 1945, by Koniev's three armies, from the Baranow bridgehead. A breach was soon made, and armoured corps poured through it, some driving westward, while others threatened the rear of the Germans who were facing Zhukov. On Jan. 14 both Zhukov and Rokossovski joined in the offensive, and the breach became 200 mi. wide. Warsaw was isolated and fell on Jan. 17, by which time Zhukov's spearheads were close to Lodz. Two days later Koniev's spearheads crossed Germany's Silesian frontier besides driving into Cracow, while Rokossovski reached the southern frontier of east Prussia. Too late, Hitler allowed German divisions to be rushed north from Slovakia; they were too few to fill such an immense gap.

Rokossovski entered east Prussia by the same route, toward Tannenberg, that Gen. Alexander Samsonov had taken with fatal results in 1914, but Tannenberg was to be reversed this time, for Rokossovski swept on past that battlefield and reached the Baltic on Jan. 26, thus isolating all the German forces east of Danzig. Meanwhile, Koniev had already reached the Oder, isolating the industrial area of Upper Silesia.

Between these two far-stretched wings, Zhukov's armoured columns drove through the corridor between the Vistula and the Warta, bypassed the great fortified communication centres of Torun and Poznan, which were thus surrounded by the motorized forces following on, and on Jan. 30 crossed the Brandenburg frontier, 220 mi. from Warsaw and barely 100 from Berlin. Next day one of his spearheads reached the lower Oder near Kuestrin, only 40 mi. from Berlin.

10. Fall of Berlin.—But the advance had gone so far and so fast that it no longer had the momentum needed to overcome the defense of this great river, which was aided by a sudden thaw. Although Zhukov gained footholds

near Kuestrin and Frankfurt in the following week, his advanced forces lacked sufficient weight to burst out. Koniev then sought to develop a flanking leverage by a push down the west bank of the Oder from Breslau, but his forces in turn were held up on the Neisse, which there provided the Germans with a convenient switch line. The Germans were much helped at this stage by the fact that their front had been forcibly contracted to only a fraction of its former extent. That contraction went far to balance their losses for the moment, giving their defense a better proportion of force to space than it had ever enjoyed since the tide of the war had turned and thrown them on the defensive. Although the Russians were baulked, it was the menace of their imminent approach to Berlin that led Hitler to decide that most of his fresh drafts must be sent to reinforce the Oder whatever the risk to the defense of the Rhine. The way was thus eased for the passage of the Rhine by the U.S. and British armies.

Early in March 1945 Zhukov enlarged his bridgehead over the Oder but did not succeed in breaking out. Russian progress on the far flanks continued, and Vienna was entered early in April. Meanwhile, the German front in the west had collapsed; and the Allied armies there were driving eastward from the Rhine with little opposition. They reached the Elbe, 60 mi. from Berlin, on April 11. There they halted. On April 16 Zhukov resumed the offensive, in conjunction with Koniev, who forced the crossings of the Neisse. This time the Russians burst out of their bridgeheads and within a week were driving into the suburbs of Berlin, where Hitler chose to remain for the final-battle. By April 25 the city had been completely isolated by the encircling armies of Zhukov and Koniev, and two days later Koniev's forces joined hands with the Americans on the Elbe. But in Berlin itself desperate street-by-street resistance was put up by the Germans and was not completely overcome until the war itself ended, after Hitler's suicide, with Germany's unconditional surrender. (B. H. L. H.)

I. The North African Campaign (1942-43)

1. Securing of Morocco, Algeria, French West Africa.—When the British chiefs of staff visited Washington, D.C., in Jan. 1942 the invasion of northwest Africa was debated. In July the desperate situation of the Russians and the unfavourable turn of events in Libya prompted the combined chiefs of staff to suspend preparations for the invasion of Europe and to launch an expedition into northwest Africa.

Lieut. Gen. Dwight D. Eisenhower, who was commanding U.S. forces in the United Kingdom, was designated to command the Allied forces in this "Torch" operation with orders to gain, in conjunction with the Allied forces in the middle east, early and complete control of North Africa from the Atlantic to the Red sea.

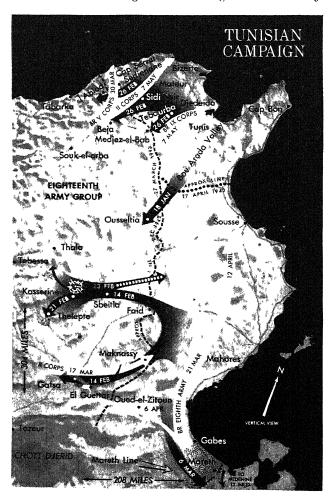

Intensive measures were instituted for the preparation, under strictest secrecy, of three task forces—western, centre and eastern. The western task force was American, including the 3rd infantry, 2nd armoured and most of the 9th infantry divisions, with supporting troops and, commanded by Maj. Gen. George S. Patton, Jr., was organized in the United States. Under Rear Adm. H. K. Hewitt this force totalling 34,000 assembled at sea on Oct. 24, 1942, and departed on its missions of capturing Casablanca and establishing communications with the centre task force, which was to land at Oran. This latter force, also U.S., included the 1st infantry, and part of the

1st armoured divisions, with supporting troops, was commanded by Maj. Gen. Lloyd R. Fredendall and numbered 31,000. The eastern task force, under British Lieut. Gen. K. A. N. Anderson, consisted of British commando and infantry units and U.S. infantry and rangers, totalling 32,000 and was to capture Algiers. In view of lingering French hostility to the British the first landings of this force were to be commanded by an American. The centre and eastern task forces sailed from England on Oct. 25 under British naval escort.

Since the ultimate objective was the capture of Tunisia, some thought was given to making other landings farther east, but lack of shipping and landing craft and the axis capability of attacking communications via proaxis Spain discouraged this project.

Adm. Sir Andrew B. Cunningham was naval commander in chief for the operation; his responsibilities included protection against attack by the Italian and Vichy French fleets. The assigned air forces were commanded by Air Marshal Sir William L. Welsh and Brig. Gen. James H. Doolittle, respectively. The western task force was supported by 171 aircraft from 4 U.S. navy carriers and the centre task force by 57 British planes from 3 carriers and by 2 U.S. fighter groups from Gibraltar. At Algiers the British furnished air support from 4 carriers and from Gibraltar.

To clinch clandestine negotiations which had been opened with a few French officials Maj. Gen. Mark W. Clark landed near Algiers on the night of Oct. 22–23

after a voyage by air and submarine. The peculiar relationship between Vichy and Berlin, the schism between the pro-Vichy and Free French elements, the veneration with which Marshal Henri Pétain was regarded by many Frenchmen and the deep-rooted antagonisms of the mixed populations of Morocco and Algeria presented political problems which were to prove insoluble.

On Nov. 5 Eisenhower established his command post at Gibraltar. Undetected, the central and eastern task forces reached the Straits, and, passing eastward, at 1 A.M. on Nov. 8 landed their assault forces. Simultaneously, President Roosevelt broadcast an assurance to the French people that the Allies sought no territory. At the same time the Spanish government was notified that no operations were contemplated against its territory. At 4:35 A.M. the western task force began its landings.

(a) Eastern Task Force.—Landings were made at two beaches west, and one east, of Algiers, against spotty opposition. One of two British destroyers carrying commando and antisabotage parties into the port was sunk by shell-fire

Adm. Jean Darlan, Pétain's designated successor, was discovered in Algiers and agreed to cease resistance at 7 P.M.

(b) Centre Task Force.—Landings against slight opposition were made at Arzeu, 30 mi. east of Oran and at 2 beaches west of the city. A U.S. paratroop mission flying 1,500 mi. from England to help capture the airfields was scattered by a storm, but such troops as landed locally aided in seizing the Tafaraoui airfield.

Two British cutters, carrying rangers and antisabotage parties into Oran to seize the port facilities, were disabled by fire from shore batteries and French naval craft; most of the personnel either became casualties or were captured. I hree French destroyers which took to sea were destroyed. At noon on Nov. 10 the city surrendered.

(c) Western Task Force.—Landings were made on Nov. 8 at Fedala and Mehdia northeast of Casablanca and at Safi to the southwest. By 10:15 A.M. Safi had been captured. At Fedala, which fell at 3 P.M., and at Mehdia (near Port Lyautey airfield) there was considerable opposition from aircraft and shore batteries, the latter being silenced by naval gunfire.

Off Casablanca three cruisers and five destroyers were engaged by the U.S.S. "Brooklyn," "Augusta" and two destroyers. One French cruiser was damaged. Later three cruisers and two destroyers were taken under fire by the U.S.S. "Massachusetts" and by naval aircraft, one French destroyer being sunk; a heavy cruiser, "Primaguet," was set afire.

Port Lyautey was finally captured on Nov. 10. A planned attack on Casablanca became unnecessary when, on Nov. 10, Darlan broadcast that hostilities should cease by 7:00 A.M. Nov. 11.

Under the armistice, Darlan agreed that Gen. Henri Giraud's forces should render active assistance in the conquest of Tunisia, the next Allied objective. He responded to the German invasion of unoccupied France by rejecting the Vichy government. Subsequently Gov.-Gen. Pierre Boisson announced the adherence of French West Africa to the Darlan regime. When Darlan was murdered on Dec. 24, 1942, control passed to Giraud, although many extremists of Gen. Charles de Gaulle's Free French party refused to compromise with him.

2. The Tunisian Campaign.—Hope of anticipating the axis in Tunisia lay in acting with utmost speed, not only against a build-up of axis forces but also against the weather. Unfortunately, the French made no resistance to

the German air landings which began on Nov. 9, 1942. On that day Lt. Gen. Anderson took over command of the British 1st army. Troops were rushed to capture Bougie on Nov. 11 and Bone the next day. Already axis air reaction was making itself felt on Allied shipping at sea and in port.

On Nov. 15 the U.S. 503rd parachute battalion dropped at Youksles-Bains and seized the airfield there; two days later it occupied the airfield at Gafsa. On Nov. 16 the 1st army encountered German patrols 60 mi. west of Tunis. Operations developed along the axes Beja-Medjez-Tebourba, Beja-Sidi Nsir, Tabarka-Djebel Abiod-Mateur. On Nov. 25, after several clashes with axis troops, Anderson's leading elements seized Medjez-El-Bab, 30 mi. southwest of Tunis and 3 days later captured the airfield at Djedeida, 16 mi. from that capital. On Nov. 25 Eisenhower moved his headquarters from Gibraltar to Algiers. The advance had now developed the axis defensive position created by the reinforcements which had been steadily pouring into Tunisia from Italy by sea and air. Further progress was checked. Winter rains set in. Eisenhower now directed Anderson to withdraw his forces to more defensible ground but to hold Medjez-El-Bab. This movement was accomplished under axis harassment and in heavy mud which resulted in a serious loss of armoured vehicles. After an unsuccessful renewal of pressure eastward from Medjez on Dec. 22, the advance on Tunis was definitely abandoned for the winter.

The ensuing months were devoted to the intensive build-up of supply installations and to bringing up reinforcements. Up until this time the advancing elements had been relatively weak, their line of communications installations necessarily sketchy. Meanwhile, the axis continued to augment its strength and to harass the Allied forces. In the latter mission it profited by its excellent modern airfields.

By contrast, Allied air forces operated under the handicap of improvised runways which frequently were mere mud strips.

On Jan. 1, 1943, Clark was appointed to command the newly created U.S. 5th army, in which the remainder of the centre task force was consolidated with the western task force, with the missions of guarding the lines of communication and of training for future offensive operations. The same day Fredendall was appointed to command the U.S. 2nd corps, which included a French division and a British paratroop brigade, with the mission of protecting the U.S. right flank and attacking axis lines of communication.

Meanwhile, Allied naval and air forces had embarked upon their task of protecting supply routes and disrupting those of the axis. With ever-increasing intensity they hammered at axis air bases in Tunisia, Sicily and Sardinia and on the Italian mainland and harassed axis sea and air communications.

At the turn of the year the French 19th corps was holding a sector on the eastern dorsal between Anderson's 1st army and Fredendall's 2nd corps. The Allied battle position ran generally along the line Medjez-Ousseltia-Faid-Gafsa. Gen. Erwin Rommel, the German commander, had sensed the lack of equipment of the French, and although retreating before Gen. Bernard L. Montgomery through Tripolitania, on Jan. 18, 1943, he struck down the Bon Arada valley at the junction between the British and French, causing both to fall back several miles and relinquish Ousseltia. In this attack the German Mark VI Tiger tank made its debut. In order to improve the organization of command and communications, Eisenhower

thereupon vested in Anderson operational control over all U.S., French and British forces in Tunisia east of the line Bone-Chott (Salt Lake) Djerid. These were grouped from north to south into the British 5th corps, French 19th corps (French and U.S. troops), U.S. 2nd corps (U.S. and French troops).

The growing strength of the U.S. forces began to make itself felt. After a successful axis attack on Jan. 30 against the French who were holding Faid pass, U.S. troops, among them the U.S. 1st armoured division, reacted to divert axis pressure by attacking eastward from Gafsa. At this moment Rommel's retreating forces arrived in southern Tunisia from Libya.

On Feb. 4 the combined chiefs of staff separated the North African theatre of operations from the European theatre

At dawn on Feb. 14 the axis launched a determined armoured attack from the Faid area toward Sbeitla-Kasserine and a subsidiary attack from Maknassy southward. U.S. forces suffered heavily and retired through Kasserine pass; Gafsa also was relinquished. The axis, following up its advantage, captured Sheitla and Kasserine as well as Thelepte with its airfield. After debouching from the west end of Kasserine pass on Feb. 21, axis troops encountered stiffening resistance to which some hastily gathered British reinforcements contributed, and on the morning of Feb. 23 began to withdraw under the heavy pressure of Allied armour strongly supported from the air. Renewed attacks by Allied ground troops and the combined efforts of all air forces maintained the German retreat, which was skilfully covered by lavish use of mines, and by March 3 contact was regained at Faid. Rommel's intention apparently had been merely to disrupt the Allied dispositions by attacking the invitingly thin line of the U.S. 2nd corps and thus gain time and space for the reorganization of the merging axis forces in Tunisia. Fired by his initial success he evidently tried to exploit it by an attack on the Allied communications in the Tibessa-Thala-Le Kef region.

With the approach of the British 8th army to the German-Italian Mareth defense line, a command reorganization became necessary. Under Air Chief Marshal Sir Arthur W. Tedder, the Mediterranean air command was created on Feb. 19 to control all Allied air forces based in the middle east, northwest Africa and Malta. Under Lieut. Gen. Carl Spaatz the Northwest African air force was formed to unify the activities of the various air elements including the British eastern air command, and the U.S. 12th air force. This command comprised a strategic air force, a tactical air force and a coastal air force. Doolittle commanded the heavy and medium bombers whose particular mission was the destruction of strategic targets such as axis naval and air bases, communications and convoys. Air Marshal Sir Arthur Coningham commanded the tactical air force with the particular mission of closely supporting the ground troops. Air Vice-Marshal Sir Hugh P. Lloyd commanded the coastal air force with the task of defending ports and convoys, conducting continual reconnaissance and carrying out shipping sweeps and antisubmarine patrols.

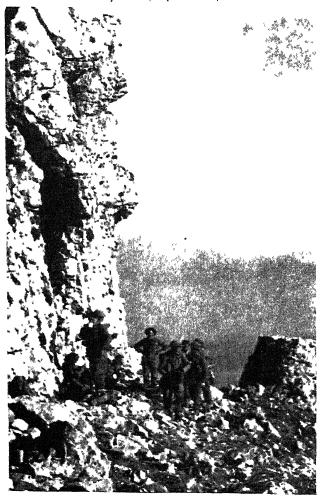

On Feb. 20, Admiral of the Fleet Sir Andrew B. Cunningham became commander in chief. Mediterranean, his area of command being extended to longitude 16° E. and including Malta.

On the same day, Gen. Sir Harold R. L. G. Alexander, commander in chief, middle east, became deputy com-

mander in chief, allied forces, and commander in chief, 18th army group, which was composed of the British 1st (Anderson) and 8th (Montgomery) armies, the U.S. 2nd coips (Fiedendall) and the French 19th coips (Alphonse Juin). Thus, the command of the forces which had pursued Rommel from Egypt through Tripolitania and of the 500,000 troops which had been built up from the landings in North Africa was unified under Eisenhower. A large proportion of the Allied strength was operating on the lines of communication.

On Feb. 26 the Germans began an attack on a wide front west of Tunis, making new gains in the Medjez-El-Bab and Beja areas and capturing Sedjenane near the north coast. The fighting was bitter and cost the axis heavily in tanks which it could ill spare. The Allied positions at Djebel Abiod and Medjez were critically exposed. On March 28, the 46th division and other units of the British 5th corps attacked to re-establish their positions and, fighting through heavy rains, recaptured Sedjenane two days later and pushed on to Cap Serrat. Following powerful artillery preparation, the 5th corps on April 7 launched the British 78th division on a ten-day advance of about ten miles which removed the axis threat to Medjez. In a despairing effort to ensure its hold on its Tunisian beachhead the Afrika Korps on March 6 made

Capture of Long Stop Hill (Diebel el Ahmera), a key to the approaches of Tunis, was accomplished by the Allies after a bitter three-day battle, April 23–26, 1943

an armoured attack on Medinine, south of Mareth; the attempt failed. Four days later an axis armoured column struck patrols of Gen. Jacques Leclerc's Fighting French column which had trekked across the Sahara from Lake Chad. Again the axis forces were defeated after being mauled by Allied aircraft. This setback marked the end of axis freedom of action. On March 17 the U.S. 2nd corps, under Patton, who had taken command on March 6, attacked the German lines of communication and recaptured Gafsa; Maknassy fell five days later.

On the night of March 20–21, Montgomery's 8th army attacked the Mareth line following a heavy air bombardment by the western desert air forces. After ten days of powerful frontal assaults and a brilliant outflanking manoeuvre by the New Zealand corps on the west, covered by overwhelming air support, the Mareth positions were breached and turned. On April 6 patrols of the 8th army and the U.S. 2nd corps joined in the region of Oued-el-Zitoun. The 8th army continued to pursue Rommel's forces up the coast while the 18th army group maintained its pressure from the west. Sousse was occupied April 12. Allied air forces meanwhile were striking hard at the German attempts to reinforce their garrisons in Tunisia by air and by sea, climaxing their achievements on April 18 when nearly 100 Junkers-52 transports were shot down.

The advance of the 8th army freed the U.S. 2nd corps for transfer to the north. With its four divisions (9th, 1st, 34th infantry, 1st armoured) this corps moved across the rear of the 1st army to reappear on the extreme left flank.

When the general offensive was resumed on April 22, such resistance was met by the 8th army that Alexander transferred to the 1st army the major offensive role, reinforcing it with divisions from the 8th. The assaults were everywhere successful and by the afternoon of May 7, units of the U.S. 2nd corps (under Maj. Gen. Omar N. Bradley, who had assumed command on April 15) had captured Mateur and were entering Bizette while the British 9th corps was entering Tunis. Axis troops retreated into Cap Bon peninsula and on May 12 Col. Gen. Juergen von Arnim was captured. The next day organized resistance ended.

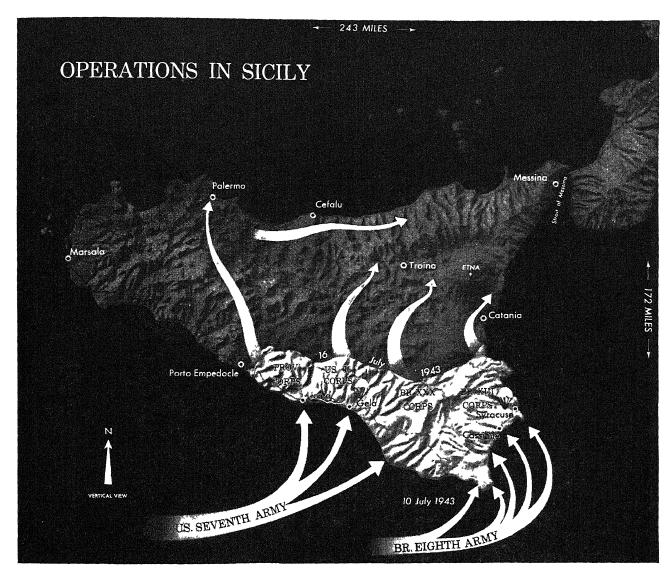

In this campaign the axis suffered more than 320,000 casualties; 252,415 German and Italian troops and their equipment were included in the final surrender. The conquest of the African continent was complete, and the Allies were in a favourable position to invade the continent of Europe. The Mediterranean was again open to Allied shipping. The French army had been reborn. U.S. troops had demonstrated their battle efficiency and had gained invaluable experience. The allied air forces had demonstrated their effective co-ordination with ground forces and the strategic application of air power. And this campaign had fully demonstrated the practicability of unitying both in command and in staff work the efforts of three Allied forces.

Allied casualties were approximately as follows:

•	Killed	Wounded	Missing	Total
British	5,920	19,000	7,680	32,600
U.S. Nov. 8-11	526	837	41	1,404
_ Nov. 12-May 13	2.715	8.978	6.528	18,221
French	6,307	8,077	4,482	18,866
Total	15.468	36 892	18 731	71.091

The following major ground units served in these campaigns:

British .					Armies 1 st	Corps 5th, 9th	Divisions 1 st, 4th, 46th, 78th infantry; 4th Indonesian;
					8th	10th, 30th N.Z.	1st, 6th, 7th armoured 51st, 56th infantry, 2nd N.Z.; 1st French
US French .	:	•	:	:		2nd 19th Corps d'Afr	1st, 3rd, 9th, 34th infantry; 1st armoured Moroccan; Algerian, Oran

3. Pantelleria, Lampedusa, Lingosa, Lampion.—The nuisance constituted by the radar stations and airfields on Pantelleria, reputed to be a second Gibraltar, and its neighbouring small islands was next to be removed. A crescendo of air attacks begun on May 20 was climaxed by continuous air and naval bombardment from June 7 to 11. At 11:55 A.M. on June 11 elements of the British 1st division landed to receive the surrender of the 11,000 detenders of Pantelleria, whose losses of less than 200 killed revealed the moral effect of the bombardment.

The air and naval attack then turned upon Lampedusa, which surrendered with 4,600 prisoners next evening. Lingosa yielded as U.S. naval craft approached; Lampion was found deserted on June 13.

On July 10, fighters based at Pantelleria supported Allied landings in Sicily.

J. The Sicilian Campaign

At the Casablanca conference in Jan. 1943 the imperative need to relieve pressure upon the U.S.S.R. had been recognized. With reasonable prospects for early success in Tunisia, consideration was given to Sardinia or Sicily as the logical next stepping stone. The fairly obvious decision was made to attack Sicily, with target date the July moon period.

For "Husky" operation Gen. Sir Harold Alexander was

to be Eisenhower's deputy in command of ground forces (15th army group).

Adm. Sir Andrew B. Cunningham and Air Chief Marshal Sir Arthur W. Tedder were to be naval and air commanders, respectively.

Although assaults upon both Palermo and Catania were considered initially, it became evident that the airfields in the southeastern corner of the island must be captured promptly lest the entire operation be imperilled. This, together with the shortage of landing craft and available troops, led Eisenhower to favour a single expedition against the 100 mi. of coast line extending from just south of Syracuse westward around to Licata. Thus, he assumed the risk of putting a substantial force ashore without the prospect of early seizure of a major port to ensure its logistical support. Success in this venture was to provide a precedent for the later landings at Salerno and in Normandy.

Allied air forces now enjoyed more than a two-to-one local superiority over those of the axis. In the air preparation, which began while operations in Tunisia were still in progress, Brig. Gen. James A. Doolittle's strategic air force hammered axis air bases and communications, while Air Marshal Sir Arthur Coningham's tactical air force performed close-range missions more directly preparatory to the assault.

On June 12 Doolittle began the intensive destruction of airfields in Sicily, rendering most of them unserviceable on D-day, July 10.

Adm. Sir Bertram Ramsay's eastern naval task force transported Gen. Bernard L. Montgomery's 8th army, which was assigned the eastern sector and which consisted of the British 13th and 30th corps. In the assault of the 13th corps were the 5th and 50th divisions and commandos; the 30th corps attacked with its 231st brigade, 51st and Canadian 1st divisions and commandos. Adm. H. K. Hewitt's western naval task force convoyed Gen. George S. Patton, Jr.,'s 7th army, consisting of the 2nd corps (U.S. 1st and 45th infantry divisions) plus a provisional corps (U.S. 3rd infantry division and part of 2nd armoured division).

The armada of Allied ships and landing craft reached the unprecedented total of 2,500. British naval forces guarded against a possible gesture by Mussolini's six battleships.

At 11 P.M. on July 9 a brigade of the British 1st Airborne division was scheduled to drop by parachute and glider south of Syracuse and seize a vital bridge and dominating points. Although many of the gliders were released off shore the bridge was captured. In the U.S. sector four battalions of the U.S. 82nd air-borne division were to parachute beyond Gela to clear obstacles for the advance on the airfields; despite scattering caused by bad weather, the paratroops prevented axis reinforcements from reaching the landing beaches. During a renewed attack two nights later U.S. planes were fired upon by U.S. naval craft through faulty identification, 23 failing to return. A similar mishap befell a second attack by the British air-borne forces.

Wind of near-gale proportions sprang up during the night preceding D day on July 10, but fortunately subsided somewhat toward H hour. In compensation the weather put the beach detenders off their guard.

The landings which began at 2:45 A.M. on July 10 met

little opposition. Licata was seized and opened to shipping that day; Syracuse was opened two days later. The occupation of axis airdromes on D day gave Allied fighters bases from which to cover further operations. Allied aircraft maintained close support, flying up to 1,200 sorties daily.

The Allies found themselves confronted by two German and nine Italian divisions. After several counterattacks against the 7th army, only one of which, northeast of Gela, became critical, the Germans disengaged and moved into positions opposite the 8th army, where, recognizing the threat against Messina, they brought in heavy reinforcements.

Problems of supply were acute during the first few days, when adverse weather and occasional axis air attacks made unloading of ships difficult and hazardous. In these operations the 2½-ton amphibious "DUKW" ("duck") trucks made their debut with phenomenal success. During the first 2 days more than 80,000 men, 7,000 vehicles and 300 tanks were landed.

Racing into the hills of western Sicily, the 7th army occupied Palermo on July 22. Patton then turned east and in hard mountain fighting, particularly in the Troina area, between Aug. 1 and 6 aided the 8th army in crumbling German resistance before Catania. Along the north coast the 7th army leapfrogged the axis defenses by amphibious operations on Aug. 8, 11 and 16; on the last date the 8th army also made an "end-run" south of Messina. On Aug. 17 the U.S. 3rd division entered Messina from the west simultaneously with British patrols from the south. In 39 days the Sicilian campaign had ended.

Under heavy anti-aircraft protection the Germans withdrew thousands of first-line panzer and air-borne troops across the strait of Messina. Nevertheless, the loss of Sicily was a major military disaster for the axis, whose casualties totalled 167,000, of which 37,000 were Germans. Losses of German heavy equipment included 78 tanks and armoured cars, 287 artillery pieces and 3,500 motor vehicles.

U.S. infantry conducting mopping up operations in the streets of Messing during the conquest of Sicily in 1943

	Killed	Wounded Missing	Total
U.S	2,059	5,373 2,332	9,764
British		7,939 2,183	12,843
French	21	54 12	87
Total	4,801	13,366 4,527	22,694

During these operations the U.S. 9th and the British 78th divisions reinforced the original assault forces.

The shock of the invasion accompanied by the heavy bombing of the Italian mainland exposed the bankruptcy of the fascist regime and on July 25, 1943, Mussolini resigned and was succeeded by Marshal Pietro Badoglio.

K. The Italian Campaign

The Trident conference held in Washington, D.C., during the latter part of May 1943 resulted in a directive to Gen. Dwight D. Eisenhower to plan such operations in exploitation of the conquest of Sicily as would be best calculated to eliminate Italy from the war and to contain the maximum number of German divisions. Available to him would be 19 British and Allied, 4 U.S. and 4 French divisions in the Mediterranean and middle east. Much of this force, however, would be involved in garrison and internal security duties. In addition, four U.S. (1st and 9th infantry, 2nd armoured, 82nd air-borne) and three British (7th armoured, 50th and 51st infantry) divisions were to be returned to the United Kingdom by Nov. 1 in preparation for the cross-channel operation.

An attack on Italy offered tempting fruits. The collapse of a major axis partner would have staggering moral effect upon the satellites. The Italian air bases, particularly those in the Foggia region, could be put to excellent use. The Allies could render more substantial support to the Yugoslav guerrillas and could seriously threaten axis positions within the Balkans.

1. Strategic Drawbacks.—The risks were evident. The Allies still had to maintain North Africa behind them. Not since the fighting in Greece had the Allies challenged the axis when its lines of communication did not cross the sea. In the first attack upon the European mainland the axis could be expected to exert every effort to maintain its prestige. The inevitable drain upon Allied shipping and manpower had to be reckoned with, plus the lengthening lines of communication entailing a heavy proportion of administrative troops—and the corresponding advantages to the axis as its own lines shortened. The political problems which had beset Italy could easily impede the conduct of military operations.

The terrain was not at all favourable for offensive warfare. The towering masses and narrow defiles of the Appennines, the countless streams, flooded in winter, flowing from them, and the marshlands along the coast offered a series of natural defensive positions against which it would be difficult to exploit to the full the anticipated Allied superiority in artillery and armour. During the winter, communications would be still further hampered by heavy snowfall. Nevertheless, the exposure of the axis flanks to amphibious attack was a weakness of which it was always sensitive.

On June 5, 1943, the 15th army group was directed to prepare plans for an assault across the Strait of Messina to capture the ports of Reggio di Calabria and San Giovanni and then to move northeastward, seizing the airfield at Crotone

The landing-craft situation presented an acute problem. No replacements from the United Kingdom or the United States could be expected; in fact, Eisenhower had been directed to send to the United Kingdom and to India a large proportion of the craft already allotted to him. Throughout the next year operations in the Mediternanean were to be conditioned by the chronic shortage of landing craft. Not only the Salerno operation but also the Anzio and southern France expeditions were to give rise to repeated demands upon the combined chiefs of staff for additional L.S.T.'s, and were to be shaped to fit the numbers of landing craft which could be available at the respective target dates.

With the collapse of the Mussolini regime, new prospects opened. An early assault upon the Naples area now offered reasonable chances of success. However, a direct attack upon the city would certainly meet stiff opposition since the Germans could be counted upon to hold this focal point to cover the withdrawal of their forces from the south. The plain to the north of Naples was beyond the range of Allied fighter aircraft and its beaches were unsuitable for landings. To the south lay the Gulf of Salerno which, although landlocked about 2-10 mi. from shore by high mountains across which the routes to Naples passed through narrow defiles, possessed a 20-mi. stretch of ideal beach. It was calculated that if all available fighter aircraft with detachable tanks were used, a continuous patrol of 36 aircraft could be maintained over the area during daylight for the few days before an air strip could be captured. Gen. Mark Clark was therefore ordered to prepare plans for a landing in the Gulf of Salerno with target date of Sept. 7. The Messina crossings would be made several days before the Salerno landings in order to release landing craft for the latter operation.

2. Invasion and Italian Surrender.—Following heavy air preparation against axis airfields, batteries and communications in the "toe" of Italy, the British 13th corps (Canadian first infantry division and British 5th infantry division) swarmed ashore at 4:30 A.M. on Sept. 3, 1943. Negligible resistance was encountered, and the strait was opened to shipping on Sept. 6. On Sept. 12 Crotone was in Allied hands.

Marshal Pietro Badoglio had established contact with Eisenhower on Aug. 19 in an effort to negotiate a surrender without the knowledge of the Germans. The combined chiefs instructed Eisenhower to accept the unconditional surrender of Italy (which was signed at Cassibile in Sicily on Sept. 3) and to obtain the maximum military advantage from this development. Responding to Badoglio's plea that the capital be seized to prevent the capture of the king and government, Eisenhower offered to fly an air-borne division into the Rome area provided that the Italians would seize the necessary airfields and silence the anti-aircraft batteries. The 82nd air-borne division was alerted to make this drop.

Meanwhile, Allied air forces had intensified their blows against axis marshalling yards, airfields, gun positions, military installations and communications. Pisa, Benevento, Salerno, Foggia, and Brenner pass, were among the many places heavily attacked. Field Marshal Albert Kesselring's headquarters at Frascati, south of Rome, were bombed out. Axis fighter opposition progressively decreased.

On Sept. 8 the unconditional surrender of Italy was announced. That day Badoglio reported that he was unable to guarantee the Rome airdromes for the air-borne landings. It was now too late to put the 82nd division on its original objective, the Volturno river, where it was to have guarded the north flank of the Salerno landings. Thus, it was rendered inactive at this critical moment.

3. The Salerno Beachhead.—At 3:30 A.M. on Sept. 9 Clark's U.S. 5th army landed on the beaches at Salerno.

A street in Naples where debris was so heavy after the city's capture in 1943 that labour corps had to clear a path before U.S. troop movements could proceed

The northern assault force which had sailed from Sicily and Bizerte under command of Commodore G. N. Olliver consisted of the British 10th corps with the 46th and 56th infantry divisions in the assault. The southern assault force which had been convoyed by Rear Adm. John L. Hall, Jr., from Oran consisted of the 6th U.S. corps with the 36th division in the assault followed by the 45th division. U.S. rangers and British commandos landed on Sorrento peninsula, the former to seize the passages leading through to the Naples plain, and the latter to capture Salerno. Having suspected that the Allies might undertake an amphibious operation against the Naples area, the Germans' reaction was swift and vigorous. Withstanding several counterattacks, both corps by nightfall had established a bridgehead four miles deep although a dangerous five-mile gap at the Sele river separated them.

Eisenhower and his ground force commander, Gen. Sir Harold Alexander, estimated that eight German divisions were available to oppose the landing. Two were in the Rome area, two were in the Naples area and four were in the south. The axis forces were heavy in armour. Shortage of shipping prevented the Allies from putting their own heavy armour into the fight until the British 7th armoured division began to unload on D-plus-5. On Sept. 10 the two Allied corps made contact at the Sele river, but the vigour of the German defensive measures increased. Every available aircraft of both the strategical and tactical air forces was thrown into the battle to halt the arrival of axis reinforcements, and heavy naval gunfire lent its support. By Sept. 12 an airstrip had been placed in operation in the beachhead; in the preceding a days 3,000 fighter sorties had been flown from Sicily and from carriers. On the nights of Sept. 13 and 14 air-borne troops were flown to critical parts of the defense and by Sept. 15 the crisis had passed.

4. Progress up the Peninsula.—As the Italian battle fleet vacated Taranto on Sept. 9, the port was occupied by the British fleet carrying the British 1st air-borne division, which two days later occupied Brindisi. On Sept. 9, 3 Italian battleships, 6 cruisers and 13 destroyers from

Spezia and Genoa, steaming southward to surrender, were bombed by German aircraft, which sank the battleship "Roma." The remainder of the fleet escaped to the Balearic Islands and to Bone. From Bone the Italian fleet moved on to Malta, where it was joined by other surrendering elements. Only a small proportion, 320 planes, of the Italian air force complied with the surrender terms by flying over to the Allies. The Italian army made apathetic resistance to the Germans; because of its lack of leadership Rome was denied to the Allies for many months to come.

On Sept. 12 Capri and other islands in the Bay of Naples surrendered. Four days later patrols of 5th and 8th armies met 40 mi. southeast of Salerno, uniting Alexander's 15th army group into a single front. On Sept. 18 the axis evacuated Sardinia to the French, and on Oct. 6 Corsica followed suit.

The 5th and 8th armies now moved forward abreast. Bari fell on Sept. 13. On Sept. 28 the 8th army occupied the Foggia airfields and on Oct. 1 the 5th occupied Naples and its harbour. Repairs to the demolished port structures were immediately begun, and on Oct. 14 unloading ceased over the Salerno beaches, where, during the period Sept. 9–Sept. 26, a total of 108,000 tons of supplies, 30,000 motor vehicles and 189,000 troops had been landed.

Capture of the Foggia airfields confirmed the Allied hold on the mainland. Large numbers of fighters could now be based relatively close to the battle area, and heavy bombers could easily strike at the passes across the Alps, add their attacks to those of the 8th and 9th air forces against Germany and disrupt industry and transportation in the Balkans to the benefit of the Red army.

German resistance, however, began to stiffen. To avoid a costly frontal attack on the port of Termoli, the British made an amphibious landing north of the city, but the axis delayed its capture until Oct. 6.

At 4 P.M. on Oct. 13, Italy declared war on Germany. One outstanding advantage brought by this cobelligerency

was to obviate the need for the Allies to establish military government.

On Nov. 1 the U.S. 15th air force was established. Primarily, this force was to be employed strategically against targets of the combined bomber offensive as directed by the combined chiefs of staff. However, its use by Eisenhower in strategical or tactical emergencies was authorized.

New divisions arrived to join the Allied forces, while the Germans hastily reinforced their own defenses. On the night of Oct. 12-13, the U.S. 2nd and 6th corps forced a crossing of the Volturno river in hard fighting. Destroying every bridge and culvert en route, the Germans withdrew to their winter line athwart the peninsula which they had been preparing since the Allied landings on the mainland. This deep position followed generally the lines of the Garigliano and Sangro rivers. The 5th army's efforts to gain control of the lower Garigliano began on Nov. 6; the 8th army crossed the Sangro two weeks later. Communications were almost nonexistent, winter was coming on and heavy rains and snows added to the handicaps. To deal with axis defenses, Allied artillery was heavily reinforced by batteries of the heaviest field pieces produced in the United States; 240-mm. howitzers and 8-in. guns were rushed to Italy. The 5th army continued to shove the axis from the succession of mountains which still barred the Cassino corridor to Rome and finally, in December, arrived before its entrance. In the same month the first of eight French infantry and armoured divisions which the United States had agreed to equip arrived in Italy.

The build-up of Allied ground forces was delayed by the necessity for using shipping to import not only the huge quantities of equipment, supplies and personnel to

U.S. troops marching northward on an Italian highway in Jan. 1944

establish and man the air bases, but also the foodstuffs to keep the Italian civil population from starvation. A setback was suffered on Dec. 2 when a German air attack confused Allied radar detectors at Bari and sank or damaged 22 freighters. By this time Adriatic ports were unloading 70,000 tons and Naples 80,000 tons weekly.

On Dec. 5, 1943, the combined chiefs of staff vested in Eisenhower responsibility for all operations in the Mediterranean other than strategic bombing. On Dec. 10 he was appointed supreme allied commander for the crosschannel invasion, and on Jan. 8, 1944, Gen. Sir Henry Maitland Wilson succeeded him as supreme commander in the Mediterranean. Lieut. Gen. Jacob L. Devers became Wilson's deputy. Gen. Bernard L. Montgomery and Air Chief Marshal Sir Arthur W. Tedder followed Eisenhower to England, Lieut. Gen. Sir Oliver W. H. Leese succeeding Montgomery in command of the 8th army. Gen. Carl Spaatz was designated to command the U.S. strategic air force with headquarters in London. Gen. James Doolittle replaced Gen. Ira C. Eaker in command of the 8th air force and Eaker assumed command of the Mediterranean air forces.

Early in January Gen. Alphonse Juin's French corps took over the right sector of the 5th army from the U.S. 6th corps, which was withdrawn to prepare for the Anzio landing.

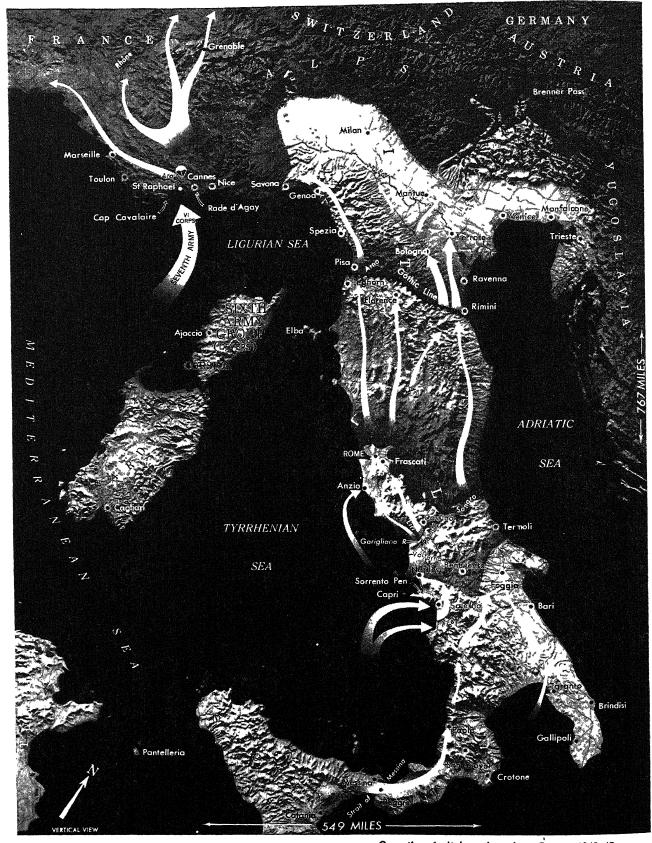

5. Anzio and Cassino.—In order to disrupt communications in the rear of the German forces in the Cassino area, the 6th corps landed on the beaches near Anzio on Jan. 22; its troops included the U.S. 3rd division, British 1st division and U.S. rangers. To divert the attention of the local axis forces from this operation the 5th army had mounted a series of local operations. The British 10th corps on Jan. 17 gained a bridgehead over the Garigliano but made no further progress. The U.S. 2nd corps (36th division) on Jan. 20–21 unsuccessfully attempted to force the Rapido. East of Cassino the French corps made considerable gains.

The Germans reacted swiftly to the landings and by the end of January the 6th corps had been sealed in by strong forces which were able to deliver persistent and accurate artillery fire throughout the flat beachhead—18 mi. long by 9 mi. deep—and against ships off shore. Axis counterattacks reached the peak of their intensity on Feb. 17, but the beachhead was held. During the four months of its existence the beachhead was reinforced by the U.S. 1st armoured, 34th, 36th and 45th divisions and by the British 5th and 56th—the last being later withdrawn.

Farther south the 5th army offensive had been halted before the strong defenses of Cassino, where raged some of the bitterest fighting of the war. The U.S. 34th division in early February and the New Zealand corps for four weeks thereafter tried unsuccessfully to capture the site. Despite pulverizing attacks by air and artillery the German defenders held on.

6. Pursuit North from Rome.—As spring approached the Allied air forces systematically destroyed all the important axis railroad yards south of Florence. Then, after thoroughly regrouping their forces, the 5th and 8th armies launched a co-ordinated offensive on May 11. As the attack gained momentum the U.S. 6th corps on May 23 struck out from the Anzio beachhead. In a swift advance over the mountains west of the Liri river, the U.S. corps on the left of the French corps joined hands with the beachhead forces. On June 4 Rome fell to the 5th army.

Both the 5th and 8th armies took up the pursuit of the

retreating Germans and in July the Allied forces reached the Arno. In mid-June a French amphibious force recaptured Elba. Leghorn fell on July 19, Florence on Aug. 13 and Pisa on Sept. 3. The 8th army passed through the

Operations in Italy and southern France, 1943-45

Apennine divide and on Sept. 21 captured Rimini. On Sept. 15 the Brazilian division had begun to move into the 5th army line.

While the pursuit was in progress it had been necessary to withdraw troops in preparation for the "Anvil" attack on southern France. The U.S. 4th corps replaced the 6th corps, and the 45th, 3rd and 36th divisions were withdrawn from the line during the last half of June. The French corps and its four divisions were withdrawn during July. Some of these troops were replaced by new units from the U.S. and by British and other forces.

On July 20, 1944, allied force headquarters moved from Algiers to Caserta.

7. The "Gothic Line."—The 15th army group now stood before the "Gothic Line," which the Germans had been preparing since early in 1944. On Sept. 10, 1944, the 5th army attacked this powerful line frontally, and the 8th army, now commanded by Lieut. Gen. Sir R. L. McCreery, pushed northwest from Rimini. Although after three months of costly fighting the line was breached, the axis had been able to establish a new defensive position.

On Dec. 12, 1944, Alexander replaced Wilson as supreme commander, Wilson moving to Washington, D.C., as field marshal to represent the British chiefs of staff. Clark was promoted to 15th army group commander, and command of the 5th army passed to Lieut. Gen. Lucian K. Truscott.

During the fall and winter months the air forces continued to pound axis communications across the Alps and in northern Italy, as well as oil and rail targets in Austria and southern Germany. In Jan. 1945 the Canadian 1st corps with the Canadian 1st infantry, Canadian 5th armoured and British 5th infantry divisions were ordered to France to reinforce the attacks on Germany.

On April 9, 1945, the 8th army launched a general attack west of Ravenna. Five days later the 5th army joined the offensive and after a week of heavy fighting drove into the Po valley and entered Bologna. Bridgeheads were established across the Po southwest of Mantua on April 23. Both armies raced across the Po valley and into the foothills of the Alps. On April 28 Italian antifascists captured Mussolini and executed him. On April 29 the Allies entered Milan; 5th army forces along the Ligurian sea captured La Spezia on April 25, swept through Genoa and Savona and advanced to make contact with the French. On every side effective support was received from Italian patriots. By May 1, 8th army troops advancing on Trieste had made contact with Yugoslav partisans at Monfalcone and the next day at noon the commander of the German armies in northern Italy capitulated. On May 4, patrols of the U.S. 88th division met those of the 7th army south of the Brenner pass.

By the dogged pressure which they had maintained for 20 months the Allied forces in Italy had made a major contribution to the common effort. Pinning down substantial strength which Hitler had needed to reinforce both his eastern and western fronts, they had accomplished the mission given them at the Trident conference.

During these operations the axis lost more than 47,000 known dead, 170,000 wounded and probably some part of the 209,000 reported missing prior to the German surrender.

Allied casualties were as follows:

				Killed	Wounded	Missing	Total
y.s				21,389	92.589	40,079	154,057
British		٠		30,782	99,773	15.071	145,626

L. Balkan Operations (1942-44)

1. Resistance in Yugoslavia and Greece.-With their mountains and lack of modern means of communication, with their populations having age-long traditions to conspire and to resist the invader, Yugoslavia and Greece were ideally fitted for guerrilla warfare. Unfortunately, the political situation did not favour a unified underground movement in either. In Yugoslavia, particularly, the resistance was divided first by the Serbo-Croat feud and secondly by the tendency of the Communist party to pursue its aims without any compromise. The German advance in April 1941, in its very swiftness, left in its rear tens of thousands of Yugoslav soldiers who hid with their arms. A month later Col. (later Gen.) Draja Mikhailovitch started to organize his chetas (companies) to fight the enemies of Yugoslavia. For the Chetniks, however, the enemies were not only the Germans but also the ustashe (insurgents) of the Croat quisling Ante Pavelitch. From the beginning, then, Mikhailovitch, who had a unique chance to be a national Yugoslav leader, appeared in the narrower role of a Serbian patriot.

This situation was skilfully exploited by the leader of the rival underground movement, Josip Brozovich, called Tito. This Moscow-trained Communist and veteran of the Spanish Civil War, where he served with the international brigades, organized his partisans and started guerrilla operations only after the German attack on the U.S.S.R. A meeting between Tito and Mikhailovitch held in Oct. 1941 was fruitless. Although at first Chetniks and partisans sometimes fought the Germans together, their relations now became strained and they even fought each other. Mikhailovitch was anxious to avoid reprisals against the civil population; he also considered that the menace of communism was at least as great as the menace of naziism or fascism. For this, after Aug. 1942, he was denounced as pro-German by the "Free Yugoslavia" radio (speaking from Tiflis). In Nov. 1942 in the small Bosnian town of Bihach, Tito convened an Antifascist Assembly of National Liberation of Yugoslavia (AVNOJ or Antifashistichko Veche Narodnog Oslobodyenya Jugoslavye), which proclaimed that the Yugoslav National Army of Liberation was fighting for a "truly democratic and federal Yugoslavia in which equal national rights not only of Serbs, Croats and Slovenes, but also of Macedonians and Montenegrins would be recognized."

The first British officer to be parachuted into occupied Yugoslavia, in Sept. 1941, was Col. S. Hudson; he was instructed by the general headquarters, middle east, to coordinate the sabotage operations of Chetniks and parti-

sans, but soon discovered how difficult was his assignment. Until March 1943, however, the British helped with money and munitions only Mikhailovitch's forces. At this time a first British emissary to Tito, Lt. Col. F. W. D. Deakin, was parachuted into Yugoslavia. He reported that the partisans had both a political and a military organization on a large scale; he also recognized that Tito's soldiers were really fighting the Germans, despite setbacks and the sufferings of the civilian population. In Sept. 1943 a larger mission headed by Brig. Fitzroy Maclean was parachuted into Bosnia and soon after came important material help to the partisans. By this time the Allies had established for the purpose a special base near Bari in southern Italy; it was no longer necessary to fly the supplies from Egypt. The British mission to Mikhailovitch was withdrawn in May 1944 and entire support was transferred to Tito. Speaking in the house of commons on Feb. 22, 1944, Winston Churchill stated that the partisans were the only people who were doing any effective fighting against the Germans and that they were checking no fewer than 14 German divisions out of the 20 in the Balkan peninsula.

In Oct. 1944 all southern and eastern Yugoslavia was liberated by the joint effort of Russians (Marshal Fedor Tolbukhin's army), Bulgarians (now fighting with the Russians) and partisans of Tito. In April 1945 all Yugoslavia was free, and although many Chetniks took refuge in Allied-occupied Italy, Mikhailovitch remained in his Serbian mountains. (He was arrested on March 13, 1946, condemned to death by a partisan court on July 16 and executed the next day at dawn.)

Compared with that of Yugoslavia, the situation in Greece was simpler in one respect; there was no feud similar to the Serbo-Croat. The political divisions were, however, serious enough not only to endanger the national unity but also to paralyze any large-scale operations against the axis. It must be remembered that Greece before the war had a dictatorship opposed by all Greek political parties. But while the royalists were ready to forgive the king for supporting Gen. John Metaxas if they were given power, the liberals and socialists were against both the dictatorship and the monarchy. After the occupation of Greece by the Germans and Italians the Communist party exploited this situation by sponsoring an underground national liberation movement (E.A.M. or Ethnikon Apeleutherotikon Metopon) which proclaimed the necessity, after the war, of a Greek republic allied with the U.S.S.R. and other Balkan republics. The E.A.M. organized its own national popular liberation army (E.L.A.S. or Ethnikos Laikos Apeleutherotikos Stratos), the commander in chief of which was Gen. Stefanos Serafis.

When the first British military mission was parachuted into Greece during the night of Sept. 30, 1942, they found that both E.A.M. and E.L.A.S. were firmly established, capably organized, not badly armed and entirely controlled by the Communist party. The G.H.Q., middle east, decided to support them with gold, arms and ammunition in the hope that they would start a large guerrilla campaign against the axis powers. In actual fact they were mainly fighting the royalist guerrilla bands such as that of Col. Dimetrius Psaras, who was murdered by the E.L.A.S., or the more important E.D.E.S. (Ellinikos Dimokratikos Ethnikos Stratos or Hellenic Democratic National army) led by Col. Napoleon Zervas. In the house of commons Jan. 18, 1945, Churchill said that the E.L.A.S. leaders "were simply taking our arms, lying low and awaiting the moment when they could seize power in the capital."

2. British Reconquest of Greece.—There was no large-scale fighting for the liberation of Greece; it was not necessary. With two Allied armies north of Florence in Italy, with the Russians holding Rumania and Bulgaria, Hitler gave Field Marshal Maximilian von Weichs, commander in chief, Balkans, the order to abandon Greece. At the beginning of Oct. 1944 small British forces under Maj. Gen. Sir Ronald MacKenzie Scobie started the liberation of the country. On Oct. 18, coming from Cairo, the legal Greek government returned to Athens. (K. Sm.)

M. Allied Reconquest of Western Europe

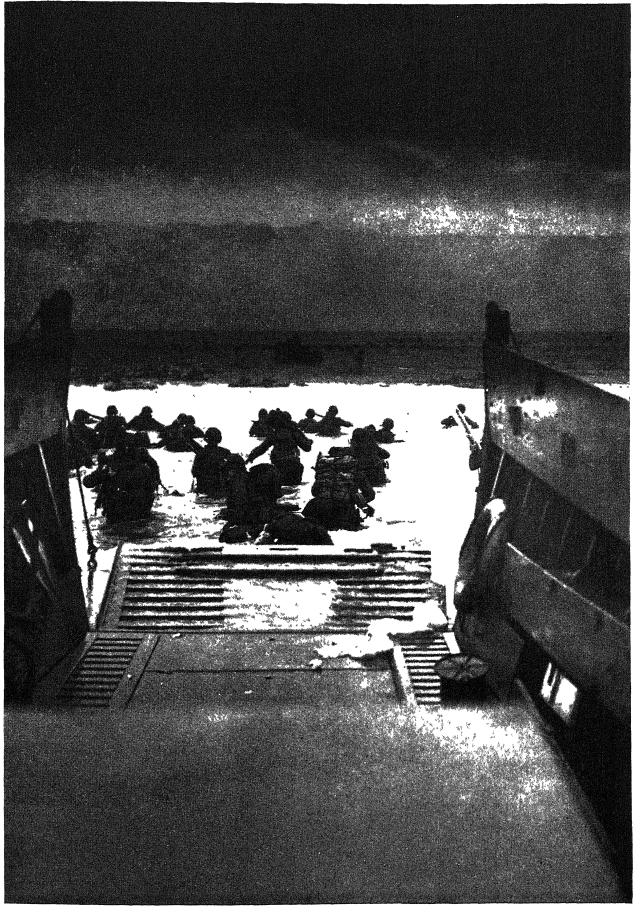

During the British-U.S. staff conversations held at Washington, D.C., in March 1941 to outline the application of the united efforts of the British commonwealth and the United States in the event that the latter was forced into the war, the cardinal principle postulated was that the defeat of Germany must be the paramount objective. With this achieved the destruction of any remaining enemies would be a less formidable task.

Meeting in London in April 1942, the combined chiefs of staff agreed that plans should be prepared for a major invasion of the continent in 1943 (Operation "Roundup"). They reaffirmed that, subject to necessary measures being taken to hold the front against Japan, all resources had to be concentrated upon the defeat of Germany. Since the Red army was at that moment sustaining the full force of the German offensive, it was decided that an operation against the continent on as large a scale as possible should be planned, for execution by the late summer or early fall of 1942 in the event that conditions so deteriorated as to render it necessary. To this contingent operation was given the name "Sledgehammer."

In June 1942 Prime Minister Churchill and Gen. Sir Alan F. Brooke, chief of the imperial general staff, went to Washington and reopened previous discussions of an operation in the Mediterranean, where the British were now falling back before Field Marshal Erwin Rommel's attack. The situation of the soviet forces was becoming rapidly worse. In this emergency Gen. George C. Marshall and Adm. Ernest King went to London to examine what could be done. Gen. Dwight D. Eisenhower had arrived in England on June 24, assuming command of U.S. forces in the European theatre. It had become obvious by this time that sufficient resources could hardly be massed in the United Kingdom during 1942 for even the "Sledgehammer" operation. The combined chiefs, therefore, reluctantly agreed to delay the cross-channel operation and to launch an expedition against North Africa in the fall of 1942. Eisenhower left England on Nov. 5, 1942, to lead this force.

In Jan. 1943, the situation in North Africa having turned definitely in favour of the Allies, it was decided at the Casablanca conference that the build-up for the invasion of northwestern Europe should be resumed and that to the same end the bombing of Germany should be continued and intensified; submarine construction yards and critical war industries which sustained German efforts were selected as initial objectives.

At the Trident conference in Washington in May 1943 a target-date of May 1, 1944, was set for "Overlord," as the revived cross-channel operation was called. At Quebec, Canada, in September (Quadrant conference) it was directed that the bombing of Germany from the United Kingdom should be supplemented by strategic bombing from bases in the Mediterranean theatre. In 1943 Lieut.

Gen. Sir F. E. Morgan had been appointed chief of staff for the supreme allied commander (Cossac); his outlined plans were now approved. The Sextant conference at Cairo, Egypt, in Nov. 1943 decided that an operation against southern France should be carried out in conjunction with the cross-channel effort. To these operations, priority over all others in the world was to be given. At Tehran in Dec. 1943 Stalin concurred in this program.

Meanwhile, the combined air attacks of the British and U.S. air forces were reaching their climax. Submarine yards and bases were heavily damaged during 1943 and the effort of the U.S. precision bombers was then concentrated against German aircraft and ball-bearing plants, aerodromes and communications. Royal air force bombers concentrated upon the destruction of industries in the Ruhr and the Rhineland and upon the undermining of the morale of the German industrial workers. The German fighter command was progressively weakened by the Allies' attacks upon its basic industries and by air combat.

1. Plans for "Overlord."—On Dec. 10, 1943, Eisenhower was appointed supreme commander of the allied expeditionary forces. Returning to England by way of Washington, he received on Feb. 14, 1944, his directive to "enter the Continent of Europe and, in conjunction with the other United Nations, undertake operations aimed at the heart of Germany and the destruction of her armed forces. The date for entering the Continent is the month of May 1944. After adequate channel ports have been secured, exploitation will be directed towards securing an area that will facilitate both ground and air operations against the enemy." Eisenhower's headquarters in England, known as S.H.A.E.F., absorbed Cossac's planning staff.

His experience in the Mediterranean theatre led Eisenhower to believe that the assault force of three divisions proposed by the Cossac planners should be increased to five and that the assault beaches should be extended from the Caen area, which they had proposed, so as to include part of the east coast of the Cotentin peninsula. These landing beaches, selected after study of the European coast from Denmark to Brittany, had the advantages of being less obvious than the strongly defended Pas de Calais area, yet were within supporting range of fighter aircraft based in England. They included no major port, but the plan contemplated early capture of Cherbourg. To seize the constricted exits from the Cotentin peninsula beaches which were isolated by floods and to assist in subsequent operations. two air-borne divisions were to land by parachute and glider. Another air-borne division would seize the bridges over the Orne river and Caen canal and protect the left flank.

Selection of the date for the assault was based upon tidal and light conditions. The tide had to be sufficiently low to enable the initial assault elements to land and prepare gaps through the beach obstacles at low-tide level. This condition had to coincide with a date having sufficient light to permit visual bombing by aircraft and bombardment by naval vessels, and sufficient moonlight on the preceding night for the air-borne landings. Chiefly because of the shortage of landing craft, some of them to come from the Mediterranean, the date of the attack was postponed from early May to early June. June 5, 6 and 7 corresponded with the requisite tide and light conditions. When rough weather developed in the channel on June 5, the date provisionally set, Eisenhower postponed D-day until June 6.

As organized for the attack, the ground forces, both Brit-

ish and U.S., were placed under Gen. Bernard L. Montgomery's command. Within his 21st army group were the Canadian 1st army (2nd corps) under Lieut. Gen. H. D. G. Crerar, the British 2nd army (1st, 8th, 12th and 30th corps) under Lieut. Gen. Sir Miles C. Dempsey, British air-borne troops (1st and 6th divisions) under Lieut. Gen. F. A. M. Browning and United States 1st army (5th, 7th, 8th and 19th corps) together with the 82nd and 101st air-borne divisions, commanded by Lieut. Gen. Omar N. Bradley. Adm. Sir Bertram Ramsay was commander of the allied naval expeditionary force. Air Chief Marshal Sir Trafford Leigh-Mallory commanded the allied expeditionary air force. The strategic air forces (R.A.F. bomber command, under Air Chief Marshal Sir Arthur Harris, and U.S. 8th and 15th air forces, under Lieut. Gen. Carl A. Spaatz) remained directly responsible to the combined chiefs of staff; after April 13, 1944, the supreme commander was authorized to call upon them when needed.

From right to left, Maj. Gen. J. L. Collins' 7th corps was to land with the 4th infantry division in the assault on "Utah" beach just north of the Vire estuary, and Maj. Gen. Leonard T. Gerow's 5th corps was to attack "Omaha" beach west of the Vire river with one combat team of the 29th infantry division on the right and one combat team of the 1st division on the left in the assault. Dempsey's British 2nd army was to land on Ouistreham ("Sword"), Courseulles ("Juno") and Asnelles ("Gold") beaches with the Canadian 3rd and British 3rd infantry divisions of the 1st corps and 50th infantry division of the 30th corps in the assault. The beaches measured about 50 mi. in length.

The objective of the 7th corps, supported by the airborne divisions, was to cut the Cotentin peninsula and seize Cherbourg. The 5th corps was to push south toward St. Lô and, with the forces from the Cotentin peninsula, drive to a line extending from Avranches eastward. Gen. George S. Patton, Jr.,'s 3rd army during this period was to build up in the beachhead with the prospective mission of capturing the Brittany ports. The British and Canadian forces were to gain ground in the Caen area and protect the left flank against an expected main German counterattack. These forces faced terrain favourable for the operation of armoured units, and it was in this region that the first strong German reaction was expected.

The navies divided the assault area between the western (U.S.) task force under Rear Adm. A. G. Kirk and the eastern (British) task force under Rear Adm. Sir P. L. Vian. Each task force was subdivided to provide for an assault force to land the troops on each of the five beaches. More than 5,000 ships and 4,000 "ship-to-shore" craft were employed in the assault and build-up, including 6 battleships, 2 monitors, 22 cruisers and 93 destroyers.

At the moment of the invasion there were 47 divisions (26 British, Canadian, Polish; 21 U.S.) in the United Kingdom. U.S. forces, including air and lines of communication troops, numbered about 1,600,000. The table on p. 709 shows the progressive build-up of the combat forces in the theatre until the German surrender in May 1945. With attached anti-aircraft, tank destroyer and tank units the divisions approximated 17,000 men each.

On May 8, 1945, the strength of Allied forces under Gen. Eisenhower's command was approximately as follows:

U.S British	٠	٠	٠	•	٠	٠																			2,585,000

Allied Forces in Northwest Europe

Available to the air forces were 4,900 fighter aircraft and 5,800 bombers.

Supplies for this operation of unprecedented size had been accumulating in the United Kingdom since 1942. In June 1944 the monthly import reached a total of 1,900,000 tons. For the invasion 2,500,000 tons were required in addition to the normal loads carried by the troop units.

In France and the Low Countries there were on D-day about 60 German divisions, of which 36 infantry and 6 panzer divisions were located in the coastal area opposite England. In the immediate area of Allied assaults Germany had nine infantry divisions and one panzer. Its 15th army was held in the Pas de Calais area to cope with what it anticipated would be the main Allied assault. This error of judgment was to prove a major factor in German defeat in Normandy. Against an invasion the Germans had built their Atlantic wall which, according to Hitler, consisted of "a belt of strong points and gigantic fortifications from Norway to the Pyrenees." Along the beaches were successive rows of various types of obstacles, many of them with mines attached.

In the late spring of 1944 the Allied air forces directed their efforts against synthetic fuel plants and crude oil refineries, reducing production during the summer of 1944 by 95%. In the spring of 1944 they also began directly to pave the way for the invasion. Attacking bridges and rail centres, they isolated the invasion coasts and thus crippled the efforts of the Germans to reinforce this critical area.

For some months prior to the invasion the Germans had created a diversion by constructing launch-

ing sites for flying bombs and rockets near the channel coast, particularly in the Pas de Calais area. Heavy bombing by Allied air forces delayed until June 12 the initial launching of these missiles which, unimpeded, could have crippled the invading fleets, or reduced London to ruins in

a brief period.

The Germans fired about 18,335 V-1 (flying bombs) between June 13, 1944, and March 29, 1945; 7,840 were fired at England, about 4,260 being destroyed in the air, and 10,595 at targets on the continent. Between Sept. 8, 1944,

Devastation at St. Lo, France, after U.S. forces broke through heavy German defenses in July 1944. After its capture, the city became an important Allied communications centre

and March 29, 1945, about 3,000 V-2 rockets were fired, of which about 1,250 were fired against England and 1,750 at the Antwerp, Belgium, area. The V-1 and V-2 missiles caused about 31,612 casualties, civilian and military, in England and probably at least as many on the continent.

2. The Assault Begins.—At 1:30 A.M. on June 6, 1944, parachutists of the U.S. 101st and 82nd air-borne divisions began to drop beyond Utah beach and those of the British 6th air-borne division east of the Orne river. Shortly after midnight 1,136 R.A.F. bombers started to unload 5,853 tons of bombs on coastal batteries between Cherbourg and Le Havre, and as day broke 1,365 U.S. heavy bombers dropped 2,796 tons on the shore defenses during the half-hour preceding the landings. Then medium, light and fighter bombers swarmed in to attack individual targets among the defenses. So thoroughly had the air forces done their work during the preceding months that the Germans reacted little in the air.

The troops made their first touchdowns at 6:30 A.M. under heavy supporting fire of naval guns as well as of tanks and artillery pieces firing from tank landing craft. Although still heavy, the sea had moderated. Some of the craft mislanded, partly because of the force of the current, but in the main the landings were made as planned. First came tanks (some with jettisonable flotation attachments -most of this type were lost), next came infantry to cover the engineers and naval crews who were to blast gaps through the beach defenses and then came successive waves of the assault infantry with their supporting weapons. Heavy resistance at some points caused serious losses to the assault waves. With great gallantry the attacking forces stormed or worked their way through the defenses and by nightfall the five sea-borne assaulting divisions were firmly ashore. Integrating their efforts with those of the ground forces and of the navies, aircraft of all types contributed in large measure to the success of this critical day.

Pinning their faith to the defensive strength of the coast fortifications, the Germans, under Rommel, had prepared relatively few inland defenses with the result that once Allied troops had breached the Atlantic wall, operations became fluid. Aggressively attacking the Germans through the difficult hedgerow country, the British and Canadians pressed toward Caen, taking Bayeux on June 8 while U.S. forces moved toward a junction of the beaches near Carentan. Outmanoeuvred, their efforts to bring in reinforce-

ments disrupted by Allied air attacks, the Germans threw in piecemeal such troops as were available; thus, they were never able to amass a mobile reserve sufficiently large to endanger the Allied beachheads. On June 11 all beachheads were linked up in a solid front.

There followed six weeks of gruelling fighting in which the Allies expanded the lodgement area and built up forces for their future breakout. The U.S. 7th corps cut the Cotentin peninsula on June 17 and, pushing northward, captured Cherbourg nine days later. The port's installations had been thoroughly demolished by the Germans, and unloading could not begin until July 19.

Delay in the acquisition of a major port had been anticipated, and to meet this deficiency the novel expedient had been devised of preconstructing two artificial ports (Mulberries), each of the size of Dover, one for the U.S. and one for the British forces. The components had been built in the United Kingdom and were towed to the Normandy coast and there assembled. A heavy storm on June 19 completely wrecked the Mulberry serving the U.S. beaches, but that serving the British was repaired and kept in service until Antwerp became available in the fall. Throughout the summer months major reliance was placed upon the arrival of reinforcements and supplies over the beaches or via this Mulberry. During the first 6 days of the invasion 326,000 troops, 54,000 vehicles and 100,000 long tons of supplies passed over the beaches. By July 4 the totals had reached 1,000,000 men, 200,000 vehicles and 700,-000 tons of supplies; and by November, 2,628,240 men, 549,664 vehicles and 4,522,192 tons.

During the latter days of June the British maintained their pressure toward Caen despite desperate but piecemeal efforts of German armoured units which revealed the German resolve to prevent, at all costs, a breakthrough up the Seine valley toward Paris. Caen fell on July 9. After the capture of Cherbourg the U.S. 7th corps turned toward the south and with the U.S. 8th and 19th corps cleared the Cotentin peninsula. On July 18 St. Lô was taken.

3. Breakout from St. Lô.—The moment had now arrived for a breakout from the lodgement area. Eisenhower decided to put to good account the German tenacity on the east flank by continuing to punch hard in that region and

following with a smashing right-hand blow. Preceded by a powerful air assault by bombers and lighter aircraft, on July 18 British and Canadian forces renewed their drive in the Caen area. Dogged resistance was aggravated by bad weather but on July 25, again preceded by a powerful air bombardment, the attack of Bradley's forces against the Germans beyond St. Lô was launched. Complete success was achieved. Coutances was captured on July 28, parts of several German divisions being cut off to the north. Only now did the Germans recognize the Allied main effort and decide to bring reinforcements to this region from the army which had been retained in the Pas de Calais. Their decision came too late.

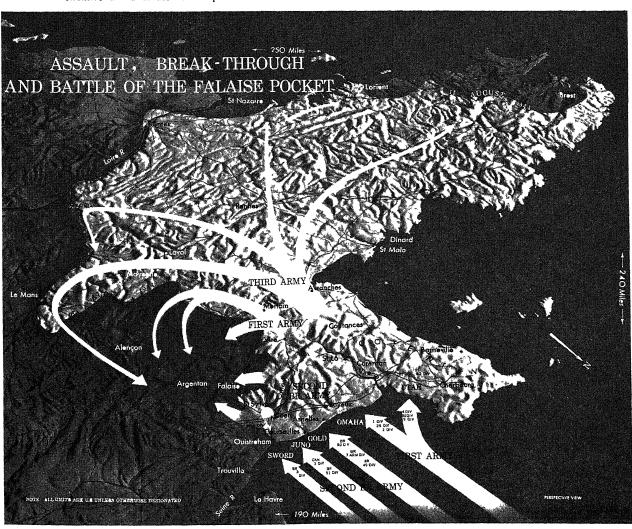

Patton's 3rd army officially came into existence on Aug. 1 when he took command of the U.S. 8th, 12th, 15th and 20th corps; the 5th, 7th and 19th corps remained with Lieut. Gen. Courtney H. Hodges' 1st army, both under Bradley's 12th army group. Crerar's Canadian 1st army had become operational on July 23, and he now commanded the British 1st and Canadian 2nd corps on the east flank. With Dempsey's British 2nd army these formed Montgomery's 21st army group. On Sept. 1 Eisenhower was to assume personal direction in France of all operations, at which date S.H.A.E.F. was established officially on the continent.

The opening of the second front, showing the invasion of Normandy on June 6, 1944, the breakthrough at St. Lô, and the offensive aimed at the Falaise pocket Pouring through the breach in the St. Lô-Coutances line, the 3rd army seized Avranches on July 31 and, in a swift amputation of the Brittany peninsula, reached Nantes on Aug. 10.

With the collapse of the Germans on the west flank, Eisenhower decided once more to adapt his plan to his opportunities and, despite his need for the Brittany ports, to turn his back upon them and make a wide encirclement of the German 7th army and panzer group west, which were still showing fanatical obstinacy, resisting in place. Leaving to his 7th corps the task of reducing the Brittany ports, Patton in a rapid advance overran Mayenne, Laval and Le Mans and on Aug. 13 reached Argentan.

As part of the manoeuvre, the U.S. 1st army and the British forces had maintained their pressure from the north and west. In a desperate effort to checkmate this offensive, Field Marshal Gerd von Rundstedt, who had succeeded Rommel, launched a panzer attack, supported by infantry, from the Mortain area toward Avranches with the hope of cutting off Patton's army from the rear. Prepared for the blow, Bradley attacked the flanks of the moving German columns and at the same time the Allied air forces blasted them from above.

4. Falaise-Argentan Pocket.—After this failure the Germans strove desperately to hold open the gap between Falaise and Argentan in order to extricate the forces caught

in the pocket which the Allies were steadily squeezing. Although many were able to escape, the Germans lost a great proportion of their equipment, and their 7th aimy was virtually annihilated as an organization. By Aug. 22 the pocket was eliminated. An interesting feature of the rapid advance of the 3rd army was the protection of its open right flank by the 19th tactical air command. Air power also played its part in the catastrophe of the German 7th aimy by persistent attacks against German communications and by raking German columns as they retreated across the Seine.

5. Attack on Southern France.—Meanwhile, on Aug. 16, the Allies had launched a heavy supporting attack in southern France.

As early as the Quadrant conference at Quebec in 1943 the combined chiefs of staff had contemplated an attack on southern France in conjunction with the proposed crosschannel invasion. At the Cairo (Sextant) conference in Nov. 1943 the plan began to take shape, and the scheme for the two operations received Stalin's approval. The demands of the operations in Italy together with the necessity for transferring forces and landing craft for the cross-channel expedition repeatedly overshadowed the plans for the southern France invasion and finally occasioned its postponement from the originally planned date of early June. However, Eisenhower's needs for additional port capacity soon pointed to the desnability of the early capture of Marseilles. Such an operation would also contain and destroy German forces which might otherwise oppose him and would threaten the flank and rear of the main forces which already faced him.

Measures were taken to organize and arm a large force of French patriots who were to lend valuable support to Allied operations. On July 30, 1944, Lieut. Gen. Jacob L Devers organized the 6th army group headquarters in Corsica. To command the landing forces Lieut. Gen. Alexander M. Patch was placed in command of the U.S. 7th army.

After prolonged aerial attacks against the communications serving this region, on Aug. 15 at 8 a.m., the 7th army, escorted by a powerful fleet of British and U.S. warships and under their gunfire, landed on the beaches between Cap Cavalaire and Agay, the area which offered the

most favourable approach to the Rhône valley. The assault forces consisted of the U.S. 6th corps with the 36th division on the right, 45th division in the centre and 3rd division on the left. Most of the U.S. forces had been loaded at ports in the Naples area, the French forces at Oran, Taranto and Brindisi. A British-U.S. air-borne task force jumped astride the Ardens river west of St. Raphael the night preceding the assault and seized the pass through which the Allied forces would debouch.

Gen. Sir Henry Maitland Wilson estimated that there were 11 German divisions in southern France, two of them almoured, but that only three would be ready to oppose the landing immediately. Weak resistance was actually encountered, the beachheads were promptly established and the main forces moved west toward the Rhône valley.

On the heels of the 6th corps the four divisions of Gen. Jean de Lattre de Tassigny's French 1st army went ashore. By Aug. 28 Toulon and Marseilles were in Allied hands and by Sept. 1 Nice had fallen. Meanwhile, part of the 36th division headed directly north, seized Grenoble and turned northwest to cut off the Germans who were retreating up the Rhône valley. This drive into the rear of the German 19th army, already under pressure from the south, together with the havoc caused by the air forces, caused it to fall back in confusion. On Sept. 3 Lyons fell.

On Sept. 15, after effecting a junction with Patton's forces, the U.S. 7th and French 1st armies, forming Devers' 6th army group, passed to Eisenhower's command. Devers was succeeded as deputy theatre commander in the Mediterranean by Lieut. Gen. Joseph C. McNarney, former deputy chief of staff in Washington.

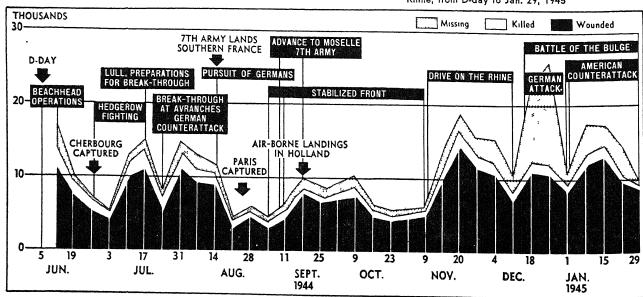

Allied casualties to Sept. 15 in the southern France campaign were

6. Advance to the German Border.—In northern France, meanwhile, the Allied armies were hard on the heels of the retreating Germans. Eisenhower's strategy called for his main effort on his north flank. In a rapid sweep the

Casualties of U.S. army ground forces during the drive on the Rhine, from D-day to Jan. 29, 1945

Canadian army cut off Le Havre (captured Sept. 12), Dieppe (captured Sept. 1), Boulogne (captured Sept. 23) and Calais (captured Sept. 30), reaching Bruges on Sept. 9 and overrunning a large portion of the Pas de Calais flyingbomb sites. The British 2nd army advanced simultaneously, took Amiens on Aug. 31 and on Sept. 4 occupied Antwerp virtually intact. The U.S. 1st army crossed the Seine east and west of Paris, captured Soissons and, turning east, freed Namur on Sept. 5, Liége on Sept. 8 and Luxembourg two days later. Eisenhower had left to a French division, the 2nd armoured, the honour of receiving the surrender of the city of Paris on Aug. 25. In pursuit the 1st army cut off and surrounded a large pocket of the retreating Germans between Compiègne and Mons, taking 25,000 prisoners. The 3rd army swept eastward, captured Reims and Châlons, overran Verdun on Sept. 1 and gained a foothold beyond the Moselle on Sept. 7. Patch's 7th army and De Tassigny's French 1st army (constituting Devers' 6th army group), which had made a phenomenal advance up the Rhône valley, from the Riviera to establish contact with Patton's forces at the little village of Sombernon near Dijon on Sept. 11, came under Eisenhower's command on Sept. 15 (see above). A continuous front now ran from the Netherlands along the French frontier to Switzerland and from Switzerland to the Mediterranean. Large German forces were isolated, of which one block of 20,000 surrendered along the Loire. Most of the ports along the channel and Atlantic coasts were still held by the Germans, Eisenhower making no attempt to reduce them after the experience at Cherbourg and Brest, where the Germans reduced their installations to ruin.

On Sept. 5 the U.S. 9th army was created under the command of Lieut. Gen. W. H. Simpson. His 8th corps (2nd, 8th and 29th divisions) finally reduced Brest on Sept. 19. Thereupon, the 9th army on Oct. 3 took over a sector of the line in the 12th army group between the 1st and 3rd armies.

Not only was resistance stiffening as Allied troops approached the threshold of Germany, but the unprecedented speed of their advance had caused them to outrun their supplies. Slowly the armies came to a halt. Herculean measures were taken to carry supplies from the beaches to the troops, including the use of aircraft and the establishment of the famous Red Ball route, a virtually continuous line of trucks operating day and night over the highways. Gasoline pipe lines were laid under the channel and carried forward behind the troops as fast as the engineers could establish them.

The direction of Eisenhower's main effort now lay across the series of Dutch rivers which included the Meuse, the Waal and the lower Rhine. On Aug. 8 he had created the 1st air-borne army under command of Maj. Gen. Lewis H. Brereton, consisting of the U.S. 18th corps (17th, 82nd, 101st air-borne divisions) and the British air-borne troops command (1st and 6th air-borne divisions). Successively, it had been intended to use this army in the seizure of the Paris-Orléans gap after Patton's break-through, then at the Seine crossings after the Falaise pocket operation and then to cut off the German 15th army in the Pas de Calais; but the swift advance of the Allied ground forces made these operations unnecessary. Eisenhower now decided upon a rapid crossing of the Dutch rivers. The name "Market-Garden" was given to this operation. In "Market," the air-borne operation, the British 1st air-borne division was dropped in the Arnheim area, the U.S. 82nd air-borne division in the Nijmegen area and the U.S. 101st air-borne division north of Eindhoven, on Sept. 17. In "Garden." the land operation, British ground forces advanced through Eindhoven and Nijmegen and made contact with the airborne units, the combined forces seizing the Waal river bridge at the latter town; but after desperate efforts to hold the lower Rhine crossings the forces at Arnheim were withdrawn. More than 20,000 troops were dropped by parachute and nearly 14,000 by gliders, together with their equipment and vehicles.

Montgomery (promoted to Field Marshal Sept. 1) now turned to opening the port of Antwerp. With naval and air support, Canadian and British forces attacked South Beveland and Walcheren Islands at the mouth of the Scheldt and completed their capture on Nov. 9. The estuary was swept and the first ship unloaded at Antwerp on Nov. 26. This important step materially eased the supply situation. Appreciating its importance to the Allies, the Germans for many months maintained a harassing bombardment of Antwerp with flying bombs and rockets but were unable to prevent, or even appreciably delay, unloading operations.

By Sept. 30 the Germans had sustained a million casualties. The U.S. 1st army entered Germany near Trier on Sept. 11, breached the Siegfried line north of Aachen on Oct. 2 and captured that German city on Oct. 21. With the approach of winter unusually heavy rains now set in.

South of Metz, the 3rd army fought its way across the Moselle, taking Nancy on Sept. 15. In the Vosges the 7th army came up abreast of the 3rd.

With Antwerp operating, Eisenhower could now complete his drive to the line of the Rhine. Rather than maintain a flexible defense, the Germans once more elected to contest every foot of the ground, with the result that they were decisively defeated west of what would have been for them a formidable natural defense and conversely yielded to the Allies that barrier behind which the latter could, with relative impunity, concentrate their forces at any point they desired for the final assault.

On Oct. 23 the 9th army was moved to the north flank of the 1st army and on Nov. 16 the 1st and 9th armies resumed their drive toward the Rhine in the Aachen sector. Aided by powerful air support, U.S. troops in bloody fighting moved forward into Hurtgen forest, and on Dec. 3 the 9th army reached the Roer river. The Germans still held the series of dams higher up this river near Schmidt; and after air attacks had failed to destroy them, the 1st army on Dec. 13 undertook their capture lest the Germans, by releasing the waters, should flood the Roer at the moment of the 9th army's crossing.

East of Thionville the 3rd army had crossed the German frontier on Nov. 18 and reached the Siegfried line near Saarlautern. The last forts of isolated Metz finally fell on Dec. 13.

Belfort was captured on Nov. 22 by the French 1st army which reached Mulhouse the same day while the U.S. 7th army, which had reached the Rhine, took Strasbourg on Nov. 27. Between the prongs of the Allied advances at Strasbourg and Mulhouse the Germans were able to maintain a bridgehead west of the Rhine, known as the Colmar pocket, which was not liquidated until Feb. 9, 1945.

7. Counteroffensive in the Ardennes.—In order to make the powerful attacks in the Aachen sector and in the Saar, the Allied front had necessarily been left thin in some regions. This was the case in that sector of the hilly Eifel between Monschau and the Moselle. It was there that Hitler decided to launch a desperate counteroffensive, presumably with the hope of capturing Liége and Antwerp and thus disrupting the Allies' supply system and severing

Encirclement of the Ruhr and the meeting of the Allied armies of the west with the Russians, in the spring of 1945

their forces. Important, too, was the prospect of dampening the offensive determination of the Allied command. S.H.A.E.F. was alive to the possibilities of such an attack but felt that the German military leaders would hesitate to undertake a counteroffensive in this unfavourable terrain and with such faint hope of success. The Germans had taken fantastic precautions to ensure the secrecy of their preparations. Volksgrenadier divisions had gradually replaced panzer divisions in this sector and the knowledge that the attack was to be made had been limited to a very few senior commanders.

On Dec. 16, aided by phenomenally heavy fog, the Germans attacked. The first brunt of the assault was borne by the U.S. 4th, 28th, 106th infantry and 9th armoured divisions. Eisenhower at once alerted the army commanders to hold their free divisions ready for support if needed, and the 101st air-borne division was rushed into Bastogne, where it held out for five days. Eisenhower directed that the shoulders of the penetration be held, and all attacks elsewhere halted. Patton was to make a major counterattack in the direction Bastogne-Cologne. An attack by Montgomery from the north was to follow. A monumental piece of staff work was performed by the 3rd army, which, during a period of six days, broke off its general attack in the Saar region, faced to the left and mounted this new attack with six divisions. Devers was instructed to extend his left flank to cover the front vacated by the 3rd army. By Dec. 19 the German penetration had become so deep as to impair Bradley's communications with his armies. Eisenhower therefore placed under Montgomery's command all U.S. troops north of the salient, leaving to Bradley's control troops on the south face, thus placing under Montgomery the U.S. 9th and most of the 1st armies.

The Germans in their attack used three armies, the 5th and 6th panzer and the 7th armies, including the 14th infantry and 10th panzer divisions. They also employed a panzer brigade using U.S. equipment with the mission of spearheading German combat units and spreading panic

and confusion behind U.S. front lines. Paratroops, dropped throughout the battle area as far to the rear as Paris, were to sabotage important bridges and headquarters. Although the penetration at its maximum reached a depth of about 50 mi. it never reached the Meuse; and since Bradley had not established any major installations east of the river in that region, this advance was not alarming. After the war it was learned from Von Rundstedt that the German high command privately conceded its failure when within 48 hours it had failed to reach the Meuse. Eisenhower's prompt measures proved successful and by Jan. 25, 1945, the original front had been re-established. Simultaneously with this attack, Devers' front had also received a German assault but had reacted promptly and successfully.

The net effect of the German effort was a delay in Allied operations of perhaps 6 weeks but a loss to the Germans of nearly 250,000 men, 600 tanks and assault guns and about 1,600 aeroplanes which they could ill afford. The attack cost the Allies about 60,000 casualties. Of greater significance was the disillusionment of the Germans at the failure of their last offensive venture.

After this battle, the German 6th panzer army departed for the eastern front taking seven panzer and three infantry divisions and virtually removing the last threat to the continuous advance of the Allied forces on the western front.

8. Drive for the Rhine.—Eisenhower now resumed his manoeuvres to destroy the Germans west of the Rhine and to reach the banks of that river. These operations were performed in three successive steps. First came Operations "Veritable" and "Grenade." On Feb. 8 "Veritable" was launched in difficult thaw and flood conditions resulting from the heavy January snows. Attacking from the Nijmegen area southeastward between the Rhine and the Meuse, the Canadian 1st army, in bitter fighting, forced its way through the Reichswald to the outskirts of Kleve and on Feb. 14 reached the Rhine at the site of the Allies'

future major crossing. On Feb. 23, "Grenade" was launched. As a prerequisite, the U.S. 1st army had captured the Roer dams by Feb. 10 after the Germans had opened the sluices of the Schwammenauel dam, causing the level of the Roer to rise about 4 ft. and thus delaying "Grenade" by 13 days. The 7th corps of the U.S. 1st army and the 19th and 13th corps of the 9th army crossed the flooded river, cleared Juelich and Dueren on Feb. 24 and 25 and rapidly gained momentum. By March 1 the 9th army had cleared Muenchen-Gladbach and had reached the Rhine at Neuss. This threat to the Germans' rear, coupled with frontal pressure, resulted in their withdrawal across the Rhine of all units below Neuss.

The next operation was "Lumberjack," in which the 1st army advanced on the right flank of the 9th army and by March 7 had captured Cologne. Farther south, on the same day, troops of the U.S. 9th armoured division seized an opportunity by crossing at Remagen the one bridge spanning the Rhine that the Germans had not yet demolished. Bradley was ordered to put not less than five divisions promptly on the far bank. Despite the Germans' frantic efforts to retrieve their error, by March 23, when the main crossings of the Rhine were begun, the 1st army had 3 corps beyond Remagen in a bridgehead 25 mi. long and 10 mi. deep. On the right the 3rd army was pushing through the rugged Eifel, crushing the German front north of the Moselle, and on March 9, reached the Rhine just below Koblenz.

The third step was Operation "Undertone," a combined offensive by the U.S. 3rd and 7th armies. Instead of further exploiting the Remagen bridgehead, as the Germans might have expected, the 3rd army attacked southward across the Moselle behind them in the Saar region; on March 15 the Germans were attacked frontally by the 7th army. Zweibruecken and Saarbruecken were occupied by March 20. The Siegfried line defense collapsed and by March 22 Mainz had been occupied by the 3rd army. That night Patton sent his 5th division across the Rhine. By March 25 all organized resistance ceased west of the river.

In all of these activities the air forces had played a conspicuous part. Particularly in the Saar offensive the tactical air units effected noteworthy destruction upon German rail and road traffic. On Feb. 22 Operation "Clarion" had involved nearly 9,000 aircraft from bases in England, France, the Netherlands, Belgium and Germany which attacked targets over an area of 250,000 sq.mi. extending from Emden to Berlin, Dresden, Vienna and Mulhouse. Their widespread blows struck minor communications facilities such as railroad signal points and grade crossings, canal locks and junctions. Against such attack the Germans could make no defense.

9. Across the Rhine; the Ruhr Pocket.-Maintaining his main effort on the north flank, Eisenhower now forced the Rhine. Under Montgomery the U.S. 9th army and British 2nd army began their crossing at 9 P.M. on March 23 near Wesel. Shortly after the ground assault the allied 1st airborne army dropped the 18th air-borne corps (U.S. 17th and British 6th air-borne divisions) north and northwest of Wesel. On the left flank the Canadian army guarded the Scheldt estuary and then followed the other two armies across the river. The whole operation was preceded by air attacks which severed all communications with the Ruhr. Since the Germans still had a number of jet aircraft which effectively assisted their defense, the airfields possessing the long runways necessary for jet operation and upon which Allied intelligence had detected that these aircraft were being concentrated, were heavily bombed from the air, thus effectively prohibiting their operation. The crescendo of air attacks reached a climax at the moment of the assault of the Rhine; from March 21 to 24 British and U.S. air forces based in the United Kingdom and the continent flew more than 42,000 sorties against Germany.

The major crossing met relatively light resistance. Contact was made promptly with the air-borne troops. Meanwhile, the U.S. 1st army attacked in the Remagen area and, breaking out to the southeast on March 26, raced toward Frankfurt. Farther up the Rhine the 3rd army crossed at several points and, clearing Frankfurt, joined hands with the 1st army in a plunge toward Kassel. On March 26 the 7th army crossed the Rhine near Worms and three days later captured Mannheim. On April 1 the French 1st army crossed the Rhine at Phillipsburg.

Now occurred another brilliant operation which constituted one of the outstanding military successes in history. Racing toward Muenster, the armoured elements of the 9th army charged around the north flank of the Ruhr and near Paderborn made contact with 1st army elements which had swept around the south flank of that area. Within the industrial heart of Germany were trapped the whole of German army group C and two corps of army group H. On March 30 the 15th army under Gerow had moved into the line along the Rhine opposite the Ruhr. Leaving strong forces to contain and reduce the defenders in the Ruhr, the 9th and 1st armies swept eastward and, with this huge operation still continuing at their backs, maintained their momentum toward the Mulde and Elbe valleys. On April 18 the Ruhr pocket was finally liquidated, German prisoners totalled 325,000, including 30 generals.

10. The Death Blow.—Berlin was no longer a military objective. The Russians were hammering at its gates. Eisenhower therefore decided to throw the weight of his advance toward Leipzig and thus cut the remainder of Germany in half. Jena, Chemnitz and Leipzig fell; and on April 18 the Allied armies set foot in Czechoslovakia. On April 25 patrols of the 273rd regiment, 69th division, 5th corps, of the U.S. 1st army met Russian patrols in the vicinity of Torgau on the Elbe, thus effecting the junction of the eastern and western allies.

Meanwhile, Montgomery's forces were sweeping the northern German plains. The British 2nd army crossed the Weser and reached the Elbe on April 19, Bremen was captured on April 26 and Hamburg one week later. Pushing northward through the Netherlands, the Canadian aimy cleared the area east of the Zuider Zee by April 21. Arnheim fell on April 15 and the Germans withdrew into Fortress Holland beyond the Grebbe and New Water defense lines which had been built by the Dutch prior to the war. There an attempt to follow the Germans would have caused them to open the dykes. Eisenhower therefore reached an agreement with Arthur Seyss-Inquart, the nazi commissioner for the Netherlands, on April 30, whereby the Allied forces were to stand on the Grebbe line and the Germans were to cease flooding the country and thus causing unnecessary distress to the inhabitants. The Germans also agreed to the introduction of food to the Dutch by land, sea and air. No further progress was made in the western Netherlands until the German troops surrendered simultaneously with those in northern Germany.

Covering the right flank of the 12th army group, the 7th army in early April pushed through Schweinfurt to Nuernberg, where stiff fighting delayed its fall until April 20. Karlsruhe fell to the French 1st army on April 4, Kehl on the 15th; and the Germans along the upper Rhine retired to the Black Forest.

Evidence had reached S.H.A.E.F. of a German government intention to leave Berlin and seek refuge in the "national redoubt" in the Berchtesgaden area. Into this mountainous region of western Austria and southern Germany Eisenhower directed the 6th army group. On April 30 the 7th army captured Munich. On May 4 Berchtesgaden and Salzburg fell, and by this swift advance the possibility of resistance within the redoubt was dissipated. On the same day, elements of the 103rd division, 6th corps, which had pushed through Innsbruck and the Bruenner pass to Vipiteno in Italy, met the 88th division of the U.S. 5th army.

Simultaneously, the French 1st army broke through resistance in the Black Forest and pushed along the southern boundary of Germany to Lake Constance, making contact with the 7th army at the western end of the redoubt. Farther east the western Allies had extended their contacts with the soviet forces.

On April 14 the French forces with powerful air assistance had launched an attack against the Germans resisting at the mouth of the Gironde, which was cleared with the reduction of the island of Oleron on May 1. St. Nazaire and Lorient held out until the final surrender of the German army.

Hitler having disappeared, the German forces surrendered piecemeal. On May 5 Adm. Hans von Friedeburg arrived at Reims representing Adm. Karl Doenitz, who had

The German surrender at Reims, France, on May 7, 1945. Seated at the extreme left, and proceeding clockwise around the table: German representatives Maj. Gen. W. Oxenius, Col. Gen. A. Jodl, Gen. Adm. H. G. von Friedeburg; Allied officers Lieut. Gen. Sir F. E. Morgan, Maj. F. Sevez, Adm. Sir H. M. Burrough, Lieut. Gen. W. B. Smith, Lieut. Gen. I. Chermiaeff (at a distance from table), Maj. Gen. I. Susloparoff, Gen. C. A. Spaatz, Air Vice-Marshal J. M. Robb, Maj. H. R. Bull and Senior Lieut. Col. Ivan Zenkovitch

taken over the direction of the German state. Gen. Alfred Jodl arrived the following day. These emissaries attempted to play for time in negotiating the surrender, presumably to allow the remaining German forces to surrender to the western Allies rather than to the Russians. Upon the threat that General Eisenhower would seal his front within 48 hours Doenitz authorized the acceptance of Eisenhower's demands for unconditional surrender, and at 2:41 A.M. on May 7 the Act of Surrender was signed by Jodl, to become effective at midnight May 8–9. This act was ratified at Berlin on the night of May 9.

Among the purely military reasons which may be given for the defeat of the Germans are: (1) Imperfect German intelligence concerning Allied intentions; this resulted largely from Allied air superiority; (2) destruction of German industries and communications by Allied air forces; (3) German failure to provide defenses in depth to meet the Allied attack once the Atlantic wall had been breached; as a result German reserves, when available, were used piecemeal; (4) German stubbornness in fighting to retain

ground; (5) superior generalship on the part of the Allies, inexhaustible supplies, care in planning and the two-front war which Hitler himself had invoked.

During these operations the Germans lost more than 80,000 known dead, 265,000 wounded and probably some part of the 491,000 reported missing prior to the German surrender.

The Allied land and air forces suffered these casualties:

	Dead	Wounded	Missing	Total
U.S.*	133,482	369,773	88.366±	591,621
Britisht	41,754	128,972	16.670	187,396

§Includes about 60,000 of army air forces.

(T. N.)

III. THE CHINESE-JAPANESE WAR (1937-45)1

A. Prior to Pearl Harbor

The overt act which made the Chinese-Japanese war inevitable was the "Mukden Incident" of Sept. 18, 1931, when Japanese garrisons in the vicinity of that important northeast city forcibly took over control from the Chinese authorities. But this incident was only a manifestation of a long-planned Japanese policy for continental Asia which became evident after the Chinese-Japanese war of 1894-95. This war resulted in Japan's occupation of Korea and gave the island empire a foothold on the mainland.

1. Background of War.—After the Russo-Japanese War of 1904–05, Japan officially proclaimed the annexation of Korea. At the same time it began to exploit China's three northeastern provinces, obviously with a view to converting them into a base for the establishment of its continental empire. In the wake of World War I, Japan extended its tentacles from the northeast to north China. At this time it acquired a mandate over the German islands in the Pacific which it began to fortify. Thus, with the simultaneous execution of Japan's twin programs of northward and southward expansion, what were later publicized as the "New Order in East Asia" and "Sphere of Co-Prosperity in Greater East Asia" gradually assumed physical shape. Because of abundant coal and iron deposits and the agricultural products in the northeast which Japan needed. together with its available manpower, in order to fight for world hegemony, the northeast became the first victim of Japan's ambition for territorial conquest. But no sooner had it considered its exploitation of the northeast complete, than it began to proclaim that north China was its "lifeline."

The Japanese adopted a policy of divide et impera in interfering with political and military affairs in China. Throughout the years of internal strife after the inauguration of the republic, Japanese intrigue or instigation in one form or another was always present. The Northern Punitive expedition, led by the Chinese Kuomintang, came to a successful end in 1928, and two years later national unification, though in crude outlines, became a reality in China. A unified China, however, was anything but agreeable and tolerable to Japan. The foreign policies of European and American nations were none too harmonious following the world economic depression of 1929. Capitalizing on this situation, Japan took a bold step forward and invaded the northeast on Sept. 18, 1931.

After taking Mukden, Japan adopted an attitude of cau-

tion and "pulse feeling." Not being prepared for the invasion, China, on the one hand, offered what resistance it could muster to the onslaughts in Heilungkiang (northernmost province) and other places. On the other hand, it tenaciously maintained its adherence to the League covenant, the Nine Power treaty and the Anti-War pact and appealed to the League of Nations and the world at large.

In a proclamation to the world on Nov. 14, 1931, China pledged full support of the "sanctity of treaties" and urged the friendly nations signatory to the various pacts to "fulfill their obligations undertaken thereunder in order that peace in the Far East and the world may not be endangered by Japan and that international justice and human ity may not be bludgeoned into submission by brute force." For China was thoroughly aware of Japan's designs. Consistently it warned the world that the northeast issue and the Sino-Japanese conflict constituted a vital, integral part of the over-all problem of world peace.

China demanded the application of Articles XV and XVI of the covenant of the League of Nations, which would mean imposing economic sanctions against Japan, but without success. As the second choice, Article X of the covenant was invoked. The result was the organization of the Lytton Inquiry commission of the League of Nations.

On the eve of the arrival in China of the commission, Japan moved again. It occupied still more cities and towns in the northeast. It started hostilities in and around Shanghai (Jan. 1932) in an attempt to menace the Chinese national capital. Determined resistance by the Chinese brought Japan to the bitter realization of the futility of intimidation. So it signed an agreement with China for cessation of hostilities in and around Shanghai.

Frustrated in the south, Japan turned its attention to the north. In March of the same year, it established puppet "Manchukuo" at Changchun, northeast railroad centre, with Henry Pu Yi, last emperor of the deposed Ching (Manchu) dynasty, on the throne. In addition, under Japanese instigation and coercion, a puppet Mongolian autonomous government appeared in Inner Mongolia.

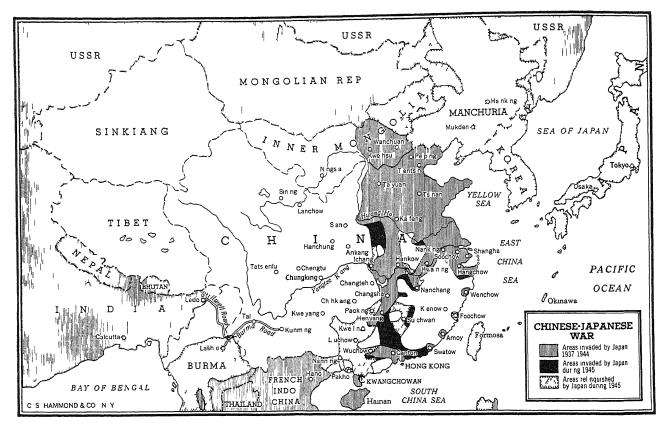

Meanwhile, the general attitude of the League of Nations was one of appeasement and timidity. It was slow to act. Worse still, the proposal of Henry L. Stimson, then U.S. secretary of state, which called for an appeal to the Nine Power treaty and the adoption of joint action by the member states, brought no response from the powers in Europe. The impotency of international treaties and the League structure made Japan all the more audacious.

Thus, the existing peace structure, the League of Nations, was flouted by Japan. Then the inevitable took place. Other aggressive, ambitious nations were encouraged to follow suit. Benito Mussolini invaded Ethiopia. Adolf Hitler marched into the Rhineland, annexed Austria and dismembered Czechoslovakia.

China, although not adequately equipped to wage a major war, was nevertheless impelled to hasten its preparation for such an eventuality. In so doing it had to trade space for time. For instance, in the hostilities of 1933, despite the desperate resistance of its soldiers, China had to yield the provincial seat of Jehol, Chengteh and the Great Wall region to the invading Japanese.

In this interval, Japan feverishly pushed forward its program of "specialization of North China," while China applied itself assiduously to consolidating its national unification. With national defense as their objective, the Chinese renovated the army, developed an air force, improved ordnance by maximum possible standardization of

¹This section, prepared by the secretary general of Chiang Kai-shek, was read and approved in manuscript by the latter.

arms, unified the national currency through the adoption of a fapi (legal tender) policy and within two and a half years rushed to completion the Canton Hankow railway, beating a schedule which called for four years

2. The "Loukouchiao Incident."—At this moment, Koki Hirota, Japan's foreign minister, adopted toward China a 'Three Point Program" for 'readjustment" of Sino Japanese relations. Under Point One, 'abandon the policy of playing one foreign country against another, Japan demanded that China recognize the existence of "Manchu kuo" and its relation to Japan as protege

Point Two, "jointly devise" effective measures for preventing the spread of Communism," was a demand for the privilege of stationing troops in certain northern provinces, apparently aimed at soviet Russia. It was tanta mount to a Sino Japanese military alliance in the cloak of "joint defense against Communism," which would have pressed China into the aggressor camp as a satellite Hirota's third point, calling for "economic co operation," aimed at expelling from China the economic interests of Great Britain, the United States and other countries and giving Japan a monopolistic position in their stead.

In order to maintain a national independent existence while upholding international justice and the interests of all friendly nations in China, the Chinese government flatly refused to consider these three points. This taxed further the "endurance" of the Japanese Samurai. Encouraged by the ever deteriorating situation in Europe and the mounting influence of noninterventionism in the United States, Japan took another determined step forward and precipitated the Loukouchiao (Marco Polo Bridge) incident

On July 7, 1937, a party of Japanese troops held a largescale manoeuvre at Loukouchiao, on the outskirts of Peiping, and, declaring that a soldier was missing, attacked the county seat of Wanping (at the southern end of Loukouchiao) The Chinese garrison resisted The fullscale war which resulted was inevitable in view of the fact that Peiping, besides having been the Chinese capital for 700 odd years, was the centre of Chinese culture and civilization and a vital strategic base in north China.

In a statement made at Lushan, Kiangsi province, on July 17, to the nation's leaders in all walks of life, who had been invited to the famed summer resort for consultation on important problems confronting the nation, Generalis simo Chiang Kai shek proclaimed the "arrival of the stage where it is impossible to avoid the inevitable." The gen eralissimo specifically defined the war as "a war between right and wrong, between good and evil, between right and might, between justice and brute force, between the treaty abider and the treaty violator." He further asserted "Once war has begun there will be absolutely no prema ture cessation or compromise. For we should realize that terms for such an alternative will be nothing but terms for a total surrender and destruction of the nation " Again, in his message of Oct. 10, 1937, to the people of China, Generalissimo Chiang called their attention to the fact that the war was one of "seeking life from the jaws of death" and that it "can by no means be concluded within a short time"

Thus, with a determination steeled by indignation and the fight for survival, China went into the war. This deter mination sustained it through the more than eight years of hard and bitter fighting.

3. Strategy.—That China had to fight a long-term war was decided on the outset. This determined its strategy of attrition. In view of the lack of the necessary for building up coastal and river defenses, the shortage of both heavy industries and heavy armament, the deficiency of the air force, a loosely knit transportation system founded on inadequate means of communication, and the slowness and difficulties in obtaining foreign aid, the Chinese su preme command took the vital decision that the Chinese should not fight decisive battles in the coastal and river

regions but should fight city by city and town by town, thereby luring the Japanese into deep inland penetrations. This strategy, not only wearing down but also spreading thin Japanese strength, was then known as "magnetic warfare."

Quite the reverse was the Japanese strategy. Encouraged by the easy success of their earlier adventures and whetted by sheer arrogance, the Japanese militarists were confident that the China campaign would not last more than three months. Following the conquest of China, they calculated that they could make use not only of their victorious forces but also of the newly subjugated manpower and material resources in their coming struggle for world hegemony. The Japanese, therefore, adopted a strategy of "a quick, decisive war" during the initial stage of the conflict. This strategy gave way to that of "a quick peace, a quick end" when Japan found China as undaunted and stubborn as ever despite the loss of Nanking, its national capital, and Wuhan, its heart. Japan, therefore, tried to employ all means and devices to entice China into a negotiated peace. This attempt, however, failed. And in view of the rapidly changing world situation, the Japanese strategy for the third stage of hostilities changed again into that of "a war to sustain war." This strategy was accompanied by the much-vaunted "mopping-up warfare." Comparable to task force operations, this latter strategy called for grouping of a sizable force to launch surprise attacks on vital strategic points, its main tasks being the dislodging of field forces, the nullifying of counteroffensive preparations and the plundering of materials. Such strategy was resorted to only when there was a shortage of military strength for distribution and when the best defense was offense.

To meet the strategic changes of Japan, Chinese strategy also varied in formula from stage to stage, but its fundamental principle remained unchanged. Without grasping this fact, there can be no true understanding of the evolution of the various battles during the Chinese-Japanese War

During the first days of the war, when the Japanese employed the strategy of a quick, decisive war, China avoided, vherever possible, large-scale, decisive battles. This was because Chinese military preparations in north China were yet incomplete, and Japanese heavy armament could easily be brought into full play on the vast plateaus there. Furthermore, the Japanese Kwantung army with its base in the already occupied northeast would have no difficulty in furnishing reinforcements. When the Japanese drove westward into Shansi province, however, the Chinese were not hesitant to hit back and, in an east-west flanking assault in September in the vicinity of Pinghsingkwan (one of the Great Wall passes in northeastern Shansi) pounded the invaders severely. In Oct. 1937 three Japanese divisions, including two crack Kwantung army divisions, were dislodged from their stronghold, Sinkow, on the north-south Tatung-Puchow railway, after suffering numerous casualties. When the Japanese fought back with large reinforcements, the Chinese withdrew to their bases in the Taihangshan and Chungtiaoshan ranges and clung like barnacles to the south Shansi triangle, which placed them in control of the four rail lines, the Peiping-Hankow, the Lunghai, the Chengting-Taiyuan and the Tatung-Puchow. These lines were used as bases for harassing and counterattacking the Japanese from behind. Another portion of the Chinese forces, following the loss of the northern section of the Tientsin-Pukow railway, retreated into the mountains south of Shantung and controlled the basins of the Yangtze and Huai rivers in anticipation of future fighting.

China also offered stout resistance to the ruthless Jap-

anese invasion of Shanghai on Aug. 13, 1937, begrudging no sacrifice. In this unfortified region, the Chinese defenders stood their ground for three months in defiance of the combined onslaught of the Japanese land, navy and air forces. Time and again reinforcements arrived from Japan, totalling approximately 200,000 men. The Chinese retreated only after having exacted a large toll from the Japanese. China, too, paid very heavily in men. The battle, nevertheless, had a tremendous bolstering effect on the morale of both the fighting services and the civilians throughout the country.

4. Fall of Nanking.-With Shanghai and adjoining Woosung in their pocket, the Japanese rumbled westward by land and by river and, with their mechanized units, swooped down on Nanking, allowing the Chinese frontline troops little breathing spell to regroup themselves. They took Nanking on Dec. 13, 1937, and plunged into the biggest slaughter ever known in human history. Even civilians were roped together and mowed down by Japanese machine-gun fire for sport. Shocking crimes were committed against women. Hardly any female, with the exception of some of those concealed within mission compounds, escaped violation. Even the very aged and the very young received no mercy from the invaders. What was worse, a great many were ruthlessly butchered after they had been raped. This wrote, in every sense of the term, the blackest page in the modern annals of mankind.

China appealed to the League of Nations on Aug. 30, while hostilities were going on in and around Shanghai. On Oct. 30 the member nations signatory to the Nine Power treaty met in Brussels, Belgium, but came to no agreement. The British ambassador, Sir Hughe Knatchbull-Hugessen, while travelling on the Nanking-Shanghai highway on Sept. 7, was machine-gunned by Japanese planes near Wusih (industrial town on the Nanking-Shanghai railway). A similar incident occurred on Dec. 12, when the U.S.S. "Panay," Yangtze river gunboat, was bombed and sunk by Japanese planes near Wuhu (rice town in southern Anhwei). These incidents well reflected Japan's flagrant, open defiance of the United States and Great Britain.

On the eve of the fall of Nanking, the Japanese sent peace overtures through the German ambassador, Dr. Oscar P. Trautmann, but these were rejected flatly by the Chinese government.

To show its determination to fight the war to the end, even over a long period, China at this juncture announced the removal of the government to Chungking, 1,200 mi. up the Yangtze from Nanking. On the night before he evacuated Nanking, Generalissimo Chiang Kai-shek in a press statement asserted that in entering Nanking the Japanese were inviting ultimate defeat. By that he ruled out completely the possibility of peace negotiations.

China, naturally, suffered a grievous blow in the loss of its national capital. Most of its troops, notwithstanding, succeeded in redeploying themselves in western Chekiang and southern Anhwei. These areas were held, till the end of the war, as bases of guerrilla warfare and counteroffensives against the Japanese rear. By virtue of its strategic location, Wuhan (the triple cities of Hankow, Wuchang and Hanyang) became the new headquarters of the Chinese supreme command.

5. Victory at Taierhchwang; Defeat at Wuhan.—In April 1938 Chinese forces in Shantung and Hopei, taking advantage of the opportunity of moving into the hilly region of southern Shantung, scored a major victory near

I aierhchwang, on the Tientsin-Pukow line. Two Japanese ace divisions crumbled in the battle. The significance of this victory was that it restored the morale of the entire Chinese rank and file, which had been impaired by the fall of Nanking.

A Japanese drive was launched against Hsuchow (important rail junction in northern Kiangsu) in May in an attempt to destroy the bulk of the Chinese strength in that sector but the invaders fell short of their objective. The fact was that the Chinese main force, after having given the Japanese considerable mauling, had long since retired to predesignated hill bases in southern Honan and northern Hupeh.

Hsuchow won, the Japanese made for the Wuhan cities, still bent on the realization of their fond hope of a quick, decisive war.

According to the original plans of the Chinese supreme command, the Chinese were to build up their counter-offensive strength west of the Peiping-Hankow and Canton-Hankow railways and to bide their time for fighting a decisive battle against the Japanese. Chinese resistance, however, was to continue east of the two railroads by capitalizing on the topographical advantages of the region, thus making the invasion as expensive as it could be for the Japanese and also trading space for time. Since Wuhan was the heart of China and a vital point on the Canton-Hankow railway and, moreover, since hills and marshlands were abundant on both sides of the Yangtze around Wuhan, it was decided to direct telling blows against the invading columns at the outer perimeter of the triple cities.

The Japanese offensive started in June 1938, with the navy blasting its way up the Yangtze to penetrate the Chinese river defenses. In a pincers movement, the invaders pushed one column from south of the Yangtze to attack the northern section of the Kiukiang-Nanchang railway with the object of covering the left flank as well as poising for a westward thrust. North of the Yangtze, the Japanese made a two-pronged advance. One prong wheeled westward along the river and another column fringed the northern foot of the Tapiehshan range on the Honan-Hupeh border in an attempt to seize Sinyang, on the Peiping-Hankow railway, and thus make a detour to the north of Hankow. The battle for the Wuhan cities began.

The Japanese lunge at Teian, on the northern Kiukiang-Nanchang line, was a costly failure, while on the north side of the Yangtze the invaders also received setbacks in a number of sectors. All in all, as many as 12 Japanese divisions were called in, with repeated regroupings and replenishments. On Oct. 25, 1938, after a campaign lasting four-and-a-half months, the Japanese won control of the Wuhan cities.

Meanwhile, in south China, Canton, seat of Kwangtung province, also fell on Oct. 21 when the Japanese attacked the southern section of the Canton-Hankow line. This marked Japan's seizure of China's last seaport.

With the conclusion of the battle of Wuhan, the Chinese-Japanese War entered a new stage, in which terrain gradually became strategically favourable to China. The Chinese main strength retired to previously-built positions west of the Peiping-Hankow and Canton-Hankow lines. The supreme command moved to Chungking. Further westward penetration by the Japanese was prevented by hazards and dangers in the Yangtze gorges. The fertile plain of Chengtu, provincial seat of Szechwan, afforded a

granary in the interior; and the Yunnan-Indo-China railway and the Burma road brought to China, though in dribbles, supplies from other countries, thereby sustaining the Chinese resistance.

Large Chinese forces, however, remained deployed in areas east of the Peiping-Hankow and Canton-Hankow railways, retaining strategic regions. To protect the left and the right flanks of Szechwan, the Chinese also massed considerable strength in the Siang river valley, north of the Yangtze, in Shensi west of the Yellow river (Hwang-Ho) as well as in the basin of Tungting lake (China's "rice bowl") and mountainous western Hunan. In fact, vast territory behind the Japanese lines remained under Chinese control. South of the Yangtze, the Chinese held southern Anhwei, eastern Chekiang and areas in Fukien, Kiangsi and Kwangtung; on the lower reaches of the Yellow river, they retained hilly southern Shantung, most of the Huai river valley and certain areas north of the Yellow river; in north China, they preserved the southern Shantung triangle despite several unsuccessful Japanese penetrations. On top of all this, the Chinese held off the Japanese for six years in the Taihangshan range (eastern Shansi) and more than four years in the Chungtiaoshan range (southwestern Shansi).

All of the guerrilla operations to harass the Japanese rear were initiated by Chinese national troops which operated behind the Japanese lines or in adjacent areas. This Chinese strategy of advance through infiltration into the Japanese rear yielded excellent results. Its execution narrowed the Japanese occupation of any locality down to the extent of a point or line rather than a large piece of territory. Thus, even after the loss of a hsien or county, the original magistrate could continue his official duties in the surrounding villages inasmuch as the Japanese occupied only the county seat. Likewise, the governor of a province would still be able to carry on his administration within his province even though his capital had been lost.

In the costly capture of Wuhan, Japan began to realize the difficulties of military subjugation. Therefore, the war cabinet under Prince Fumimaro Konoye changed to the program of a quick peace, a quick end. To that end, every artful strategem was exploited; and, in order to slacken the Chinese army's will to fight, propaganda was dosed out that Japan was willing to cease fighting first. All these overtures of peace were spurned by the Chinese generalissimo.

Realizing that it could no longer hope for a negotiated peace, Japan, in the winter of 1938, entered into liaison with the Chinese arch defeatist, Wang Ching-wei. Wang deserted from Chungking to the Japanese side, and March 1940 saw the inauguration of his puppet regime in Nanking and the conclusion of a Japan-Wang secret treaty. In these events the Japanese designs for establishment of a "New Order in Greater East Asia" were fully exposed.

Japan, on the one hand, tried to work for the disintegration of the central government in Chungking. On the other, beginning in May 1939, the Japanese carried out unremitting and indiscriminate bombing of Chungking and other cities in the interior.

China at this time was under most trying circumstances, both internally and externally. Its official invocation of Articles XVI and XVII of the League covenant in Sept. 1938 had failed to bring any tangible result from the League except denunciation of the Japanese use of poison gas and adoption of a report urging the member states to abstain from any action that would weaken China. The League council meetings the following year, in January, May and September, again failed to achieve the collective

application of Article XVI of the covenant, aside from the passing of a resolution requesting the member states to "hold consultations to consider individually measures to aid China." As it was, China's only consolation was the branding of Japan as an aggressor.

What tormented China most at this juncture was the growing paucity of war supplies. Although it was capable of producing acceptable light arms and ammunition, there was an acute shortage of raw materials. Conversely, Japan, through its open sea lanes, shipped in all the U.S. scrap iron and metals and all the U.S. and Netherlands Indies gasoline it could possibly get.

Having attained its objective of blockading the south China coast through the occupation of Canton, Japan plunged headlong into the planned realization of its "Greater East Asia Co-Prosperity Sphere" design. It occupied Hainan Island and the Spratley Islands, respectively, in Feb. and March 1939. Upon the invasion of Hainan Island. Generalissimo Chiang Kai-shek sounded a warning to the world that it was "the 'Mukden Incident' of the Pacific," but it drew no attention from the nations concerned.

6. Situation After Outbreak of European War.—The outbreak of war in Europe in Sept. 1939 removed the big nations still farther from the far eastern arena. They strengthened their so-called appearement policy and continued to give up pawns to Japan.

China, on the other hand, wavered not a whit in its determination to carry on resistance. In an address of the Chinese generalissimo before the People's Political council on Sept. 10 of the same year, he asserted: "... The Sino-Japanese conflict is not merely a world issue but one of the utmost importance. The present turmoil in the world is due mainly to Japan's wanton invasion of Chinese territory and violation of international pacts, thereby jeopardizing world peace. We of China are fighting to perpetuate our national independence and existence, and also to check the rise of international gangsterism, of which Japan is the ringleader, as well as to uphold justice and peace under the sun. In short, the Sino-Japanese war was the starting point of a general conflict, and is the real center of the present world-wide struggle." In that same year, on Oct. 29, the generalissimo declared at a military conference at Hengshan (southwest of Changsha, seat of Hunan province) that "we must fight on till the world war is ended and righteousness and justice fully vindicated, and only then shall we have attained our final victory.'

In the continued execution of the appeasement policy of the big powers, Great Britain, on June 19, 1940, signed a Tientsin agreement with Japan and on July 18 declared closure of China's only remaining international outlet, the Burma road, for a period of three months. On the day following the signing of the Anglo-Japanese Tientsin agreement, France, too, concluded a Franco-Japanese agreement, which closed the Yunnan-Indo-China route of transit. On Sept. 22, an agreement was concluded between Japan and Indo-China, permitting Japanese troops to enter Indo-China in three columns and to use the airfields in southern Indo-China as bases for bombing southwest China. On Sept. 29, in full appreciation of nazi Germany's military supremacy, Japan officially signed a Tripartite pact with Germany and Italy.

Following a directive to stop the licensing of aviation gasoline shipments to Japan in August, the United States on Oct. 16, 1940, placed an embargo on the export of scrap iron and steel to the island empire. Two days later, on Oct. 18, the Burma road was reopened, after three months of closure. Not until July 1941, however, did the Nether-

lands Indies begin to stop shipping oil to Japan.

In this period, Japan was becoming increasingly aware of the futility of its plan for a quick peace, a quick end, and of the tremendous development of a global struggle. With the view, therefore, of conserving its military strength and, simultaneously, of exploiting the material and manpower resources in occupied China through the various puppet regimes, Japan reoriented its China program and decided upon a war-to-sustain-war plan. This new program, as announced, was also one for long-term warfare, long-term reconstruction. In the northeast, fresh impetus was given to the development of the coal and iron industries. In the other occupied areas the Japanese established so-called national policy companies to issue paper currency and readjust taxation in order to absorb resources and materials.

Meanwhile, Japan's military blockade and pressure against Chungking continued. In the month following the outbreak of the European war (Oct. 1939), the Japanese staged a big drive on the Hunan capital, Changsha. But they were thrown back with heavy losses as the result of fierce Chinese resistance and encircling operations at the perimeter of the city. In November, a fresh Japanese push started in south China, resulting in the occupation of Nanning, Kwangsi capital, and other localities in southern Kwangsi. However, in the ensuing encounters at Kunlunkwan, strategic mountain pass (northeast of Nanning), which culminated in the Chinese recapture of the pass and the Japanese retreat to the city of Nanning, the Japanese lost very heavily. (The Chinese regained Nanning in the following October and, three years later, in Oct. 1944, lost it to the Japanese again.) In May 1940, in order to remove the Chinese threat to the Wuhan cities, the Japanese started separate drives in southern Honan and northern Hupeh. Taking advantage of their mountainous positions in Tungpehshan and Tahungshan on the Honan-Hupeh border, the Chinese, in a flanking movement, sent the Japanese back.

But at that time the war situation took a very critical turn. In June China lost Ichang, trading town in western Hupeh and gateway to the Yangtze gorges, thus giving the Japanese a greater threat against Chungking. Thereupon, in August, the Japanese subjected Chungking to successive, terrific air bombardments but again failed to break China as anticipated. Rather, the Chinese went on building industries in the interior in preparation for a protracted struggle.

7. Japan's Pre-Pearl Harbor Offensives.-In 1941, desirous of playing its part in the global theatre, Japan made repeated attempts to crush the Chinese field forces and eliminate the Chinese menace to their rear. In January they staged a fresh drive in southern Honan, throwing in huge forces. Chinese operations taking advantage of the mountainous terrain of Tungpehshan and Tahungshan again compelled the Japanese to retreat from Nanyang to the Sinyang sector on the Peiping-Hankow railway. A violent battle was fought in northern Kiangsi in March when the Japanese attempted to seize Shangkao, southwest of Nanchang (provincial seat), with the aim of clearing up the hilly northwestern part of the province, a mounting threat to the flank of the Japanese in case of a swoop on Changsha. The Japanese not only failed in this attempt but suffered greatly as the result of a Chinese task force attack. In May, the Japanese carried out another operation on the worst appendix behind their lines, the Chungtiaoshan range, against which they had during the preced-

ing 5 years launched more than 15 unsuccessful attacks. This last appendectomy proved a success, but part of the Chinese defensive force broke through and infiltrated into the Japanese rear.

However, the Chinese remained hostilely entrenched in the Taihangshan range, an additional thorn in the flesh of the Japanese. Consequently, in Oct. 1941, when the Japanese in the Yellow river valley crossed over the flooded areas to attack Chengchow, key city in central Honan and rail junction of the Peiping-Hankow and Lunghai lines, they were intercepted and forced to retreat. This was partly because of frontal Chinese resistance and partly because of the harassing of the Chinese in the Taihangshan range, another testimony to the success of the Chinese strategy of advance through infiltration into the Japanese rear.

In the same year, in September, the Japanese made another drive on Changsha but took another defeat at the beginning of October.

On April 13, 1941, Japan and the soviet union signed a neutrality pact. They mutually recognized "Manchoukuo" and Outer Mongolia. Two days later, Pres. Franklin D. Roosevelt declared that the United States had begun listing materials for China under the Lend-Lease act such as had been extended to Great Britain and Greece. He said: "China likewise expresses the magnificent will of millions of people to resist the dismemberment of their nation. China, through Generalissimo Chiang Kai-shek, asks our help. America has said that China shall have our help."

B. After Pearl Harbor

1. One World War.—The bold Japanese attack on Pearl Harbor in Dec. 1941 marked the realization of Generalissimo Chiang Kai-shek's premonition of the Mukden Incident of the Pacific. To other nations, it was a sheer surprise; to China, a logical certainty. For the stupid and arrogant Japanese militarists were seasoned at adventurism and opportunism. Nevertheless, the incident changed not merely the war situation of the world but also, in a much greater degree, the war situation in the far east. It marked the integration of the far eastern front and all other fronts into the global theatre.

In conformity with its consistent stand for international pledges and commitments, China on the day following the sneak Japanese attack declared war against the three major axis nations, Japan, Germany and Italy. Until this date China had not formally declared war on Japan lest the latter's belligerent status permit interception and seizure of China-bound military supplies on the high seas. There was no ground for such apprehensions now. Although the outbreak of war in the Pacific had a most stimulating effect on China, it entertained no overoptimism as to the conduct of the war during the initial stage. Rather, it was anticipating another interval of great tribulation.

Inadequate preparation in the beginning of the Pacific war caused a series of Allied reverses and setbacks—the successive fall of Guam, the Philippines, Hong Kong, Singapore and Rangoon. Not only was the Burma road closed, but the hostilities spread to China's back door, Yunnan province.

Its own difficulties and hazards notwithstanding, China assembled three of its crack armies, the 5th, the 6th and the 66th, which it had reserved for a general counter-offensive, and force-marched them to the Burma border to assist the Allied forces. Repeated negotiations with the Allied authorities gained the Chinese expeditionary force

entrance into Burma and had it placed under the U.S. general, Joseph W. Stilwell. By that time the Japanese had already penetrated into Burma from Indo-China and Siam

The Chinese on March 25, 1942, launched a vigorous offensive against the Japanese converging on Toungoo, important rail city in lower Burma. But because of the lack of time for developing an Allied air force capable of supporting ground troops and the disunity of Allied command coupled with army supply difficulties, the general battle order deteriorated into fighting by isolated units. The disparity between the Allied and the Japanese forces widened even more because of the latter's superior air might and easy sea supply. After a bitter defense of more than ten days the Chinese expeditionary force retreated because of lack of reinforcements.

Undaunted, the Chinese carried on the campaign on the Burma border. In the middle of April, at great risk, they rushed to the rescue of a besieged Allied force at Yenangyaung on the Irrawaddy river. After two days and nights of terrific fighting the Chinese breached Japanese defenses and reached the Allied troops, including several high-ranking commanding officers.

Western Yunnan was invaded when Lashio, Burmese terminal of the Yunnan-Burma highway (April 29), and Wanting, highway town on the Yunnan border, tell to the Japanese. Enormous losses were suffered by the Chinese expeditionary force, including the loss of Divisional Commander Tai An-lai of the 200th division. When the Burmese campaign was pronounced definitely lost, a part of the Chinese troops withdrew to Chinese soil, and another, led by Lieutenant General Stilwell, retreated to Ledo on the eastern Indian border. This latter Chinese force, upon regrouping and training in India, later played a vital role in the Allied counteroffensive in Burma.

Generalissimo Chiang Kai-shek accepted supreme command of the China theatre of war on Jan. 3, 1942, and the Pacific war command was established in Washington, D.C., on March 30. Thenceforth, a more co-ordinated strategy was made possible between China and its allies.

Nevertheless, China's chief problem remained. It was the complete paralysis of its overland communication with the outer world and the inadequacy of its air transport. The most effective aid it received then was from the American Volunteer group (later known as the "Flying Tigers") formed in Kunming (Yunnan capital) by the U.S. Maj. Gen. Claire L. Chennault in Aug. 1941. Scores of air victories were won by these airmen over the Kunming region, thereby reducing Japanese air raids on other interior cities. On July 4, 1942, the duties of the American Volunteer group were taken over by the 23rd fighter squadron of the United States army air force. In March 1943 the 14th air force of the United States army was officially inaugurated, and, by the latter half of that year, China had gradually gained control of its air domain.

2. New Japanese Objectives.—After the Pearl Harbor outrage the Japanese continued and intensified their war to sustain war program on the China front whereby Chinese resources and manpower were exploited to sustain Japanese military operations on other fronts. At this stage the Japanese war blueprint had a threefold objective: (1) to intensify its military blockade and blows against China; (2) to destroy the Chinese air bases in order to curb U.S. air activity in China and (3) to make maximum exertions to put a corridor through the continent in view of the growing shortage of seaworthy vessels and the mounting U.S. air menace. The Chinese formulated a new operational plan aiming at smashing these Japanese objectives

and thus achieving their twin objectives of protracted warfare and attrition. In the meantime, they tried to build up their combat strength, paving the way for a coordinated action with the anticipated Allied general counteroffensive.

Toward the close of 1941, Japan, intent upon accomplishing its first military objective as outlined above, pitted a large army against Changsha for a third time. Against this fresh drive the Chinese prepared a much better timetable than on the previous two occasions. The Chinese garrison in the city of Changsha stubbornly resisted the invasion, thus neutralizing large Japanese forces, while its own position remained firm and unshaken. Other Chinese units, deployed on the exterior lines, closed in on the Japanese in a counterencircling movement and gave heavy blows to group after group of Japanese reinforcements. On Jan. 15, 1942, came the wholesale debacle of the invading army after having suffered heavy casualties.

With a view to consolidating their hold on north China, the Japanese launched so-called mopping-up operations against the Chinese-held Taihangshan range in the summer of 1943. This was the third drive the Japanese had made against that region. Outnumbered, and with their supply line severed, the Chinese gave up their mountain base in early August.

Simultaneously in western Hupeh, the Japanese, in heavy strength, lunged forward from the south side of the Yangtze, along the northwestern corner of the province, reducing the important pass of Yuyangkwan (southwest of Ichang). The Japanese push was aimed at a westward thrust against Enshih, war capital of Hupeh, thereby threatening Chungking, and also at a southward thrust against Changteh on the west bank of Tungting lake. The Chinese struck back, taking advantage of their mountainous positions, delivered a serious blow to the invaders and compelled them to retreat on May 31.

On Nov. 2, 1943, the Japanese massed a strength of more than 100,000 men and hurled them against Changteh in a full-scale attempt to seize the rice bowl of Tungting lake and to threaten the left wing of Changsha. Changteh changed hands several times but was finally retaken by the Chinese after five days. The battle ended late in December in favour of the Chinese. Japanese losses were high and, testifying to the severity of the fighting, the Chinese lost three division commanders. Effective Chinese air support was the most important factor for this victory: it was the first time throughout the China war, which had entered its 6th year, that as many as 280 interior-based bombers had been thrown into a single battle.

The Japanese northern Burma and western Yunnan campaigns were also integral parts of their general operations during this period.

In order to attain its second post—Pearl Harbor military objective on the China front, the Japanese carried out wide-spread sorties and sweeps against the Chinese air bases, particularly those built for the U.S. air force. At a time when there was a critical shortage of machinery and instruments in China because of the Japanese blockade, construction of these air bases in many cases involved use of hundreds of thousands of labourers, and oftentimes several months were spent for the completion of a single base.

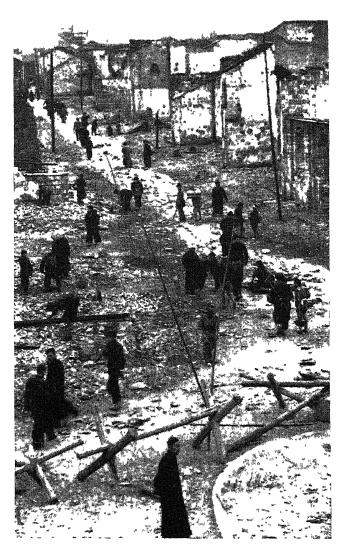

These bases presented a positive menace to the Japanese, all the more so since the Doolittle raid on Tokyo, Yokahama and Osaka on April 18, 1942. The battle of the Chekiang-Kiangsi border in the summer of 1942, though in itself a mopping-up operation, was primarily designed to neutralize the largest seaboard airfield at

Chuhsien in eastern Chekiang. Likewise, the Japanese objective in the drives on Suichuen and Kanchow in southern Kiangsi in Jan. 1944 was the destruction of the airfields in those localities. In addition, they sought to achieve full possession of the Canton-Hankow railway. The 35 days of fighting that ensued took a heavy Japanese toll.

In October of the same year, the Japanese attacked and took the twin Kwangsi cities of Kweilin and Liuchow, also because they were important strongholds of the Chinese and U.S. air forces. In May 1945 the Japanese threw their last stakes into an all-out assault on the Chihkiang airfield in western Hunan but underwent a disastrous defeat at the hands of newly trained Chinese ground forces supported by air operations.

As a necessary move toward the attaining of its third military objective in post-Pearl Harbor China operations, Japan tried to gain full control of first the Peiping-Hankow line and then the Canton-Hankow line, thereby forming

The recapture of Changteh from the Japanese in Dec. 1943 was an important Chinese victory in the Sino-Japanese War. Chinese refugees are shown re-entering the ruined city

a corridor from the south to the north of China to be linked with the main military transportation artery of Indo-China and Burma. This need became all the more pressing to the Japanese in view of the extensive U.S. bombing operations in the Pacific theatre. Thereupon, the Japanese, at the end of April 1944, took Chengchow, Honan, strategic city on the northern section of the Peiping-Hankow railway, and, in May, fought into Loyang with the object of consolidating their defenses west of the railway. By June 17, 1944, they had won complete control of the entire line.

Moving toward its next objective, full possession of the Canton-Hankow railway, Japan brought up ten divisions early in May and threw them into what was its fourth drive on Changsha. The Hunan capital fell on June 19 as the result of a flanking movement by large Japanese forces from the east and west wings. Pushing south along the Canton-Hankow line, the invaders converged on Hengyang, important rail centre in southern Hunan, with good airfields. The Chinese garrison of the city, the 10th army, was ordered to make a determined stand at all costs in order to upset the Japanese military timetable for occupation of the entire length of a transcontinental line of communication. This lone Chinese force checkmated the Japanese advance for 48 days and fought virtually to the last man. The battle for Hengyang, though finally lost on Aug. 8, went down in history as one of the most heroic defense actions in the Chinese-Japanese War.

Though the Japanese succeeded in occupying the whole Canton-Hankow line, the lack of time for repairs prevented through traffic even by the conclusion of the war. The four Changsha battles, the Hengyang defense and several major encounters on the Peiping-Hankow line, therefore were closely related to the global war.

3. Shansi Front.—A summary of the Shansi front is essential before we describe the general war situation in China on the eve of the all-out counteroffensive.

Ever since the Japanese invasion of Shansi and seizure of the Tatung-Puchow railway in 1938, practically the whole of western and northern Shansi, with the exception of a handful of hsien (counties), had been under Japanese control. In reality, the contending forces kept a vigilant watch on each other across the Yellow river.

That the Japanese never pushed across the Yellow river for westward thrusts was the result of two causes. In the first place, such attempts would have made heavy claims on men and caused an overextension of their supply line. The other cause was purely political in character. The Chinese Communist party possessed armed troops, which at the outbreak of war hardly exceeded 10,000 men. When the hostilities began, the Communist party had announced its acceptance of the Three People's principles of Dr. Sun Yat-sen, its support of the national government and its obedience to the command of Generalissimo Chiang Kai-shek in the nation's united resistance to Japanese aggression.

The Chinese Communists participated in the battle of Pinghsingkwan in northeastern Shansi; but, after the Wuhan battle, they went counter to their promises. Instead of obeying the supreme command, they tried to develop their own strength to be used in a future struggle for political power and to carry out their Communist revolution. For that purpose they made frequent attacks on national troops in order to seize weapons from them. Being fully preoccupied with the resistance campaign against a powerful foe, the Chinese government was unable

to prevent such attacks. The Communist activities, therefore, sorely grieved the government. It was precisely with the purpose of exploiting and intensifying this internal strife in China that the Japanese had abstained from crossing the Yellow river and attacking Shansi Province.

4. Increased Air Transport.—Beside devising effective measures to thwart the three major Japanese military moves in the post-Pearl Harbor period, China held to the strategy of protracted warfare pending aid from the Allies and, at the same time, reorganized and renovated its army in order to co-ordinate it with the future Allied counteroffensive. But everything hinged upon the reopening of international communication lines and the inflow of Allied arms and war materials.

From July 1942 on, U.S. supplies began trickling by air into Kunming, Chinese terminal of the China-India shuttle, via the Himalayan Hump. Not until the formation of the United States 14th air force in the following year, however, was there air cover or protection and a subsequent increase in air cargo tonnage. Hardships and hazards undergone by these Hump fliers wrote a brilliant record of bravery and self-denial. Most of the cargo flown in was aviation gasoline and equipment, which were sorely needed by the Chinese. There was no way of bringing in heavy arms, and only limited quantities of other arms were flown over the Himalayas. For these reasons, China pooled its resources with its allies to hack out the Stilwell road from Ledo on the eastern frontier of India to Yunnan and laid an oil pipe line through the entire length of the highway. It also fought a bitter battle to reopen the old Burma road and even had to fight for control of certain sections of the Stilwell road.

By then the United States had a fairly large and powerful air fleet based in China, and the huge airfields under construction in various places in Szechwan came into use one after the other. And by 1944 China-based U.S. Superfortresses were shuttling back and forth between China's interior and the Japanese empire on bombing missions. Contributory to the success of these raids was the intimate collaboration between the Sino-American Co-operation organization and the United States navy, which supplied military intelligence and reports on weather conditions along the China coast.

5. Japan's Last Adventure.—The Chinese army that was regrouped and trained by U.S. instructors for the general counteroffensive was composed of two portions. One portion comprised, in addition to the India-based Chinese troops as its nucleus, air-borne men and officers selected for their good qualities from among various units within China. The second portion consisted of a selected number of interior-based units transferred to Kunming and vicinity to be re-equipped and given intensive training by U.S. army personnel. Both were intended for performing China's role in a co-ordinated Allied counteroffensive against Japanese-held Burma.

Just as these picked troops were in training in Yunnan and the Chinese were still nursing their wounds sustained in the battle of Changteh, the Japanese, in the winter of 1944, drove with a powerful force into Kweichow from northwestern Kwangsi, heading toward Tushan, railroad and highway junction. The sudden and swift Japanese advance threatened the rear of Kweiyang (provincial seat of Kweichow) and China's war capital, Chungking. The Chinese fought back, making use of the favourable topography, and, by the beginning of December, forced the Japanese to retreat. Thus, the last Japanese adventurous move in China failed.

At that time Generalissimo Chiang Kai-Shek sent out a

"Join the Army!" call to the students of universities and secondary schools throughout China. It instantaneously brought to the colours nine divisions of students. This marked another forward step which China took to pit its strength against the Japanese in co-ordination with future Allied landings and counteroffensive operations against Japan.

China's six India-based divisions and about 10 Yunnanbased divisions (there were 36 divisions at the time of the Japanese surrender), in co-ordination with Allied forces, opened up well-timed assaults and counteroffensives separately in north Burma and western Yunnan.

On the north Burma front, they captured Maingkwan on March 5, 1944, and Kamaing shortly afterward. On June 26 they took Mogaung, important Japanese base in northern Burma, virtually putting out of existence the Japanese 18th division. Meanwhile, a Chinese task force, in collaboration with U.S. units, made a daring penetration against Myitkyina, important rail town in northern Burma, and in one swoop captured the city's airfield. The city itself fell on Aug. 3, thereby removing for the Allied air transport command the danger of Japanese air interception and the hazards of Hump flying.

On the western Yunnan front, on May 10, 1944, the Chinese effected a forced crossing of the swift Salween river and battled their way, inch by inch, through the most difficult mountainous terrain and under adverse weather conditions. By Sept. 7, Sungshan, Japanese stronghold in western Yunnan, was recaptured, thus re-opening the important Huitung bridge spanning the Salween. On Sept. 14, another Japanese stronghold, Lungling, fell. With these achievements, the Chinese were now able to start the construction of the northern section of the Stilwell road.

In Jan. 1945 Wanting, the last Japanese base on the old Burma road, was recovered. By the end of that month the historic juncture of Chinese forces striking from the north Burma and Salween fronts took place at Maymyo in eastern Burma, which marked another significant Allied success and rendered possible the repairing of the old Burma road. These troops from the two fronts, fighting in wellnigh unnegotiable territory and inclement weather, demonstrated a tenacious combat spirit and achieved an excellent battle tally that formed an important chapter in the war history of the Allies.

Attesting further to the combat strength of these newly trained Chinese troops on their own soil, which had already been well demonstrated in the Salween offensive and the battle for Chihkiang (allied air base in western Hunan), were the Chinese counterattacks against Kweilin and Liuchow (Kwangsi cities) at the end of April 1945. The Chinese advanced in two separate columns. One prong restored Nanning, border town near Indo-China, toward the close of May and by the middle of June was converging on the Liu river. Another prong made for Ishan, rail town northwest of Liuchow on the Kweichow-Kwangsi railway, which changed hands time and again. Well-co-ordinated assaults by both columns caused the Japanese to evacuate Liuchow at the end of June and Kweilin at the end of the following month. By then the weakening of the Japanese fighting strength became even more obvious.

6. Surrender.—Following the capitulation of nazi Germany in May 1945, sea battles moved ever closer to the Japanese homeland while intensified air assaults were made upon important Japanese cities. In China, increasingly high-degree co-ordination of Sino-U.S. combat strength for the continental counteroffensive was being attained. Japan itself realized that it had lost the contest.

China, the United States and Great Britain, on July 26, jointly announced the Potsdam declaration. On Aug. 6 the first atomic bomb was dropped on Hiroshima, and, three days later, the second atomic bomb fell on Nagasaki. On Aug. 9, the soviet government declared war on Japan. On the afternoon of Aug. 10, Japan's surrender offer, accepting the Potsdam terms, was forwarded to the Allies through the governments of Switzerland and Sweden. After four days, the Japanese government officially proclaimed Japan's unconditional surrender on Aug. 14.

On Sept. 2, the representatives of China's supreme command participated in the formal signing of the instrument of Japanese surrender aboard the U.S.S. "Missouri" in Tokyo bay. In Nanking, on Sept. 9, Gen. Yasutsugu Okamura, commander in chief of the Japanese expeditionary army in China, officially signed the surrender instrument for the China theatre in the presence of Gen. Ho Yingchin, commander in chief of the Chinese army and personal representative of Generalissimo Chiang Kai-shek, supreme commander of the China theatre. Thus, the Chinese-Japanese War of 8 years and 2 months or, rather, the continuous Chinese-Japanese hostilities of 14 years after the Mukden incident, were brought to a victorious conclusion.

The area in which China was to accept the Japanese surrender comprised China and Indo-China north of latitude 16° N., but excluded the Japanese Kwantung army in the northeast, which was to surrender to the soviet union. The surrendering Japanese troops, which represented the entire remaining Japanese strength during the closing stage of the war, totalled about 1,300,000 (including about 30,000 in northern Indo-China but excluding those in the northeast). These were the troops which had been pinned down in China during the final phase of the war and which otherwise could have been used in other war theatres. This was the net result achieved through China's magnetic warfare strategy.

Throughout the war of more than 8 years, 22 large-scale battles, 1,117 major encounters and 38,931 minor engagements took place. China's total casualties amounted to 3,211,419 officers and men, including 1,319,958 killed, 1,761,335 wounded and 130,116 missing. Altogether, 14,050,521 able-bodied men were conscripted. Civilian casualties were far heavier; they included victims of shellfire, air raids and slaughter; those who were killed while constructing roads and airfields or transporting military and food supplies to the front and war refugees who fell exhausted by the wayside. Losses of public and private property, including that either destroyed or wasted, were incalculable.

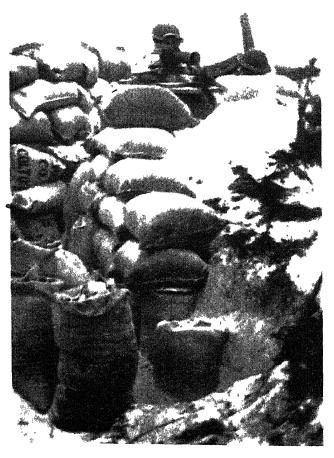

Aside from its strategical blunders, Japan's failure may be traced to four fundamental causes: (1) the militarists' excessive underrating of the opponent's strength, and their opportunistic and speculative mentality, led to their reckless moves and ultimate self-ruin; (2) the absence of far-sighted, firm-willed statesmen at the helm of the state and the frequent conflicts inside of the militarist groups which controlled the government, as evidenced by the repeated cabinet changes in wartime Japan; (3) Japan's blind faith in the supremacy and dominance of military force over everything else; (4) a nationalistic education and narrow-gauged patriotism which centred on loyalty to the emperor and developed a feudalistic national character. Added to these was the blending of technological research with the worship of military force, which rendered it difficult for the Japanese to live peacefully with other racial

groups in the modern society of nations.

The Japanese claimed that they knew China and were well grounded in China, having an understanding of the individual habits and traits of Chinese political and social figures. As a matter of fact, they saw only the individual trees, not the whole forest. China's military might at that time was far weaker in comparison with Japan's, but Japan did not know: (1) that China's vast territory was a force; (2) that China's teeming population was a force and (3) that China's national characteristic of tenacious resistance against any foreign rule, a legacy of China's long, continuous history and culture, when blended with national consciousness developed by the Three People's principles of Dr. Sun Yat-sen, was also a vital force. That any aggressive act in China would constitute a threat to world peace and therefore a grave world problem baffled Japan's understanding and appreciation even more.

It seemed a miracle to many that China, despite its inferior military might, was able to resist the Japanese aggression for more than eight years. Of course, the final victory was won by China in co-ordination with its allies. Nevertheless, during the first four-and-a-half years of war China fought singlehanded against powerful Japan. Especially during the two years and more following the war in Europe, it struggled with a prospect darkened almost completely with gloom and dismay. But it never weakened or cringed from the Japanese. The integration of the China front with the other sectors of the world after the outbreak of war in the Pacific, the initial reverses of the

Machine gun nest operated by U.S. soldiers during the Japanese attack on Oahu, Hawaii, Dec. 7, 1941

Allies and the subsequent "Europe first" strategy—these forged China ahead, with greater hope but in more intense tribulation, until the winning of the ultimate triumph

It was the firm will of the entire Chinese nation that made this indomitable and bitter resistance possible. In this gigantic struggle China staked what it had and what it was against the aggressors. The whole Chinese people endured stoically all privations and sacrifices because they wished not only to preserve their national sovereignty and existence but also to perpetuate that sense of righteousness which was the blended product of Chinese history and culture. (C. P. LI.)

IV. THE WAR IN THE PACIFIC

A. The Period of Japanese Victories

The Japanese attack in the Pacific was initiated by a dawn surprise raid of two hours' duration against the United States Pacific fleet at anchor in Pearl Harbor, Hawaii, on Dec. 7, 1941. The raid was carried out by 105 planes, launched from 6 carriers which, together with the necessary protecting warships, formed a task force under the command of Vice-Adm. Chuichi Nagumo. This task force was covered by an advance expeditionary force commanded by Vice-Adm. Mitsumi Shimiza, which consisted of 3 light cruisers, 20 submarines and 5 midget submarines.

Present in Pearl Harbor at the time of the attack were 94 ships of the United States Pacific fleet. Eight battleships, three light cruisers, three destroyers and four other vessels were either sunk or damaged. The army and navy also lost 155 planes with 81 additional out of commission after the attack because of extensive damage. Personnel casualties amounted to 2,335 killed, 1,236 wounded and 982 missing.

Coincident with the attack on Pearl Harbor, the Japanese struck at Manila, Hong Kong and Malaya.

- 1. Hong Kong.—The attack on Hong Kong, which was garrisoned by 12,000 British and Canadian troops, started with a dive-bombing raid that destroyed the air power of the garrison, leaving the city at the mercy of the Japanese bombers. Pushing down Kwangtung peninsula, Japanese ground troops penetrated the Kowloon defense lines and forced the British defending forces to withdraw to the island of Hong Kong. By Dec. 24 the Japanese had established themselves firmly on the island, and by bombing and artillery fire had destroyed water supply facilities. Faced with overwhelming force and a total lack of water, the remnants of the British garrison surrendered on Dec. 25, 1941.
- 2. Malaya.—On Sept. 22, 1940, the Vichy French government signed an agreement with the Japanese by which the latter were allowed to place a garrison of 60,000 troops in French Indo-China. They soon gained control of the port of Saigon, which they immediately converted into a naval base. A long-standing border dispute between Thailand (Siam) and French Indo-China was seized upon by the Japanese in early 1941 as an opportunity to gain control of the former country. Thus, Japan stood poised to strike at the rich southeast Asia empire (Burma, Malaya and the Netherlands Indies), whose natural resources it had long coveted. On Dec. 8-9, 1941 (Malayan time), Japanese troops landed on the east coast of the long, narrow Malay peninsula, in order to secure the airfields of Kota Bharu, Singora and Patani. They immediately pushed troops across the narrow Kra isthmus, cutting land communications between Burma and Malaya.

During the ensuing six weeks, the Japanese forces in a two-pronged advance down the east and west coasts of

Pearl Harbor naval air station after it had become a target for Japanese high explosive and incendiary bombs on Dec. 7, 1941

the peninsula pushed back the British defenders, whose successive defense lines were made untenable by leapfrog amphibious landings along the coast and swift flanking movements through the Malayan jungles. The Japanese gained an early advantage in the campaign when the two strongest units of the British fleet in the Pacific, the battleship "Prince of Wales" and the battle cruiser "Repulse" were sunk off Kwantung by Japanese torpedo planes, on Dec. 10, 1941. The two ships had been sent north from Singapore to strike the invasion fleet. An inexplicable failure to provide air protection permitted them to fall an easy prey to Japanese air power. The destruction of these two ships assured the safety of the Japanese sea communications with their invading forces.

On Jan. 3, following U.S.-British-Dutch discussions in Washington, D.C., the command structure of Allied forces in southeast Asia was unified, with the title A.B.D.A.C.O.M. (Australian, British, Dutch, American command). Supreme command was entrusted to Gen. Sir Archibald Wavell, British army. Lieut. Gen. George H. Brett, U.S. army, was designated as deputy commander in chief. Air Marshal Sir Richard Pierse, R.A.F., commanded the allied air force, while Adm. Thomas C. Hart, U.S. navy, was in command of the woefully weak combined naval forces. Generalissimo Chiang Kai-shek commanded the ground and air forces located in China.

On Jan. 31, 1942, the hard-pressed British troops in Malaya withdrew to Singapore Island, destroying the causeway connecting with the mainland and leaving the Japanese in complete possession of the Malayan peninsula.

The attackers lost no time in making preparations for the attack on the island stronghold. Under an unceasing aerial siege, ground forces were concentrated for an allout assault across the Straits of Johore. Protected by an intense artillery bombardment, successful landings on a ten-mile front were made during the night of Feb. 8–9, 1942. The Japanese quickly repaired the causeway and rushed reinforcements, including armour, to their extensive bridgehead. They pushed rapidly south toward the city of Singapore and forced its unconditional surrender on Feb. 15. Japanese military forces employed in the conquest of Malaya totalled approximately 80,000. The British casualties numbered 127,000, of which 64,000 were natives and

Indians. Japanese losses totalled 31,200.

3. The Philippines.—On Dec. 8, 1941 (Philippines time), eight hours after the Pearl Harbor attack, Japanese planes struck heavily at the United States airfields in the Philippines, destroying the majority of the bomber and fighter planes. Two days later, the naval base at Cavite was destroyed in another raid. However, the weak United States Asiatic fleet, commanded by Admiral Hart, had evacuated the base, moving southward to cover the convoys bringing British reinforcements to Singapore.

On Dec. 10, Japanese troops landed on the north coast of Luzon, and the next day strong Japanese forces were put ashore at Legaspi, on the island's east coast. However, Gen. Douglas MacArthur, who commanded all forces in the Philippines, correctly interpreted these efforts as diversionary attacks and kept the major portion of his forces concentrated in the central Luzon plain. A minimum of strength was detached to cover the eastern and southeastern approaches to Manila.

The assault on Luzon began in earnest on Dec. 21, 1941, when Japanese troops from 70–80 transports began landing on the eastern shore of Lingayen gulf. Faced by overwhelming superiority of strength, the defending Filipino-U.S. forces fought a delaying action which permitted an orderly regrouping of troops. On Dec. 25, 1941, Manila was declared an open city in a futile attempt to save it from further bombing. Manila was abandoned on Dec. 31, 1941, and a skilful withdrawal was executed into the mountainous Bataan peninsula, which, together with Corregidor, controlled the entrance to Manila bay. Manila was occupied by the Japanese Jan. 2, 1942.

The siege of Bataan, which began on Jan. 1, 1942, and continued until April 9, was characterized by the courageous and skilful defensive action of the defending forces. Lacking ammunition, medicine, food, transport and many other military essentials, they withstood the continuous assaults of the Japanese attackers.

On Feb. 22, 1942, orders were issued from Washington for Gen. MacArthur to proceed to Australia to become supreme allied commander of the newly created Southwest Pacific area. However, it was not until March 11 that MacArthur left Bataan and Gen. Jonathan M. Wainwright assumed command of the hard-pressed garrison as well as the forces still resisting on the other Philippine Islands.

The complete exhaustion of the physical and material resources of the defenders, coupled with an all-out Japanese attack which crushed the entire right flank of the U.S. final defensive position, compelled surrender on April 9, 1942. Approximately 1,367 individuals escaped to Corregidor (q.v.) from a total strength on Bataan of 30,853 combat troops and 40,795 ineffectives.

The Japanese immediately brought heavy artillery to bear on the fortified island of Corregidor. On May 5, 1942, after nearly a month of heavy artillery and air bombardment, Japanese landing forces gained a secure foothold on the island. The next day the defenders capitulated, followed on May 10 by the surrender of the Filipino-U.S. forces on the southern islands commanded by Brig. Gen. William F. Sharp.

The defending U.S.-Filipino forces incurred approximately 53,250 military casualties, including killed, wounded, missing and captured, while the attackers lost 31,500 killed and wounded. (W. A. WR.)

4. Burma.—The early phases of the war in Burma were shaped before it began by the brief campaign in Malaya. In those few disastrous weeks Britain had lost command of the Indian ocean. Its hastily gathered land and air forces had also been depleted, either to reinforce Singapore or to hold the chain of airfields which still connected it with Burma and India.

When in Jan. 1942 the Japanese struck from Siam across the jungle ranges toward Rangoon, they were opposed by forces which were little more than a light defensive screen. The outlying airfield garrisons were evacuated barely in time to escape annihilation or capture. The Japanese were close upon Moulmein, at the mouth of the Salween river, before the British could oppose the invasion with more than a single brigade. Though this was reinforced up to the strength of a division, it was forced into retreat almost at once to avoid encirclement. Fighting a desperate rearguard battle, the 17th Indian division was almost destroyed in February at the Sittang river, the last moat lying between the invaders and Rangoon. The interlude, however, had been sufficient for the deployment of a second weak division which lay farther northward in the Shan states. The reinforcement of an armoured brigade still left the British outnumbered and unable to contain the Japanese drive on Rangoon, the only seaport remaining to the British in southern Burma. Its fall became certain when fresh Japanese forces began to pass across the only two roads which ran north from it toward India.

Rangoon had already been bombed by the superior Japanese air force and was burning. Gen. Sir Harold Alexander (later Field Marshal Viscount Alexander of Tunis), who assumed command of the British troops at this critical moment, ordered its evacuation. He drew back his army upon a line covering both roads. By this decision, he averted a second Singapore trap and permitted a rather disorderly retreat northward. Alexander was thus able: (1) to bar what might otherwise have developed into a Japanese rush upon India; (2) to scorch the oil fields along his line of march and (3) to gain time for Chinese reinforcements to enter Burma at a point farther north, from the neighbouring province of Yunnan. The fall of Rangoon of course deprived his army of all means of communication with India except by land, and beyond Mandalay no roads of any kind led across the Chindwin and over the wild mountains of Manipur into Assam. The problems of retreat were further complicated by the 100,000 Indian, Burmese and British refugees who fled before the Japanese

sword and the knives of the Burmese guerrillas whom the invaders had organized. By this time the air forces which supported the British army as it trudged toward the frontier were reduced to a few fighter planes manned by the royal air force and the American Volunteer group, under Col. Claire L. Chennault, which had been in Rangoon en route for China at the time of the invasion and had distinguished itself in the air battles over the city.

By swift outflanking marches and infiltrating tactics, the Japanese had driven the Allies completely out of Burma by the end of May. The British made their way into India along a road hastily constructed by planter labour to meet them. Their rear-guards still fought, but it was the onset of the monsoon which finally halted the Japanese advance. A curtain of rain divided the two armies for the next six months. Most of the Chinese withdrew up the gorges of the Salween river into their own country, though a number marched with their U.S. commander, Gen. Joseph W. Stilwell, over the Naga hills into India. During the lull which followed, both sides built up their strength for the next encounter. This came when Field Marshal Lord Wavell, then commander in chief in India, launched a limited offensive down the Arakan coast, with the object of recapturing the island of Akyab with its port and airfields. Lacking equipment, combined operations on a serious scale were not possible. The land forces made a rapid initial advance but were soon held up by the strong Japanese defenses. Malaria took a still heavier toll among the British and Indian troops. The Japanese vigorously exploited the change of fortune. Driving up the British land flank, they cut their communications and disrupted their rear. The British were compelled to fall back and take up new positions along the Indian frontier to guard against a Japanese advance up the coast to Calcutta.

This second reverse in Burma was barely offset by the success of two other enterprises, one British, the other U.S. The first of these was Brig. Orde Wingate's intruder march deep into the Japanese-held country east of the Chindwin river. Moving in several columns, Wingate's raiding force blew up bridges, railways and dumps behind the Japanese lines for three months. About one-third of his force made its way back to India. The chief value of this daring mission, however, was not the disruption which Wingate caused to the Japanese rear. It was to prove, first, that with effective leadership and training, British and Indian troops could master the Japanese in jungle warfare; second, that it was not necessary to rely upon a supply train moving laboriously (and because of Japanese raids, dangerously) along the floor of the jungle. Once across the Chindwin, Wingate's expedition was supplied entirely by air. Thus the pattern was set for that complete air-army strategy which two years later was to revolutionize the fighting in Burma and the art of war itself.

The U.S. innovation was also in the air. In the last days of the retreat from Burma, a U.S. pilot had flown a military aircraft from Assam across the Himalayas to China. He thus blazed the pioneer trail across the vast mountain barrier known in the armies as "the Hump." During that summer, Dakota aircraft brought more than 13,000 Chinese troops back over the Hump to India. This regular air service was carried on without loss throughout the fierce monsoon storms and with no fighter protection in an area where the Japanese held air mastery. It was the beginning of a two-way traffic that developed into one of the greatest war supply achievements of all time. A fleet of 300 planes plied the sky to China; they took across the 18,000-ft. mountains field guns and every other kind of weapons, ammunitions, motor transports, tank parts, staff officers, expert in-

structors. An aerial shuttle run was established from Patterson field, O., to Assam, delivering aeroplane parts to the end of the longest supply line in the world within five days. From beyond the Hump, on the return passage, came thousands of Chinese soldiers to be trained in India under General Stilwell. Another U.S. project, though one which was not to bear decisively on the campaign for many months, was the building of the Ledo road. This magnificent military highway started in Assam and was designed to climb the mountain wall of Burma, descend into the northern valleys and link with the old Burma road. (F. O.)

5. Netherlands Indies.-The Japanese strategy for the conquest of the Netherlands Indies consisted of an encirclement, coupled with a thrust through the centre. Their initial move was a landing, on Dec. 22, on the northwestern coast of Borneo in British Sarawak. This landing, preceded by a heavy bombing, followed by two days the Japanese capture of Davao, on Philippine Mindanao, where they immediately organized a strong air and sea base. From this base they began heavy bombing raids on Jan. 10, 1942, striking at Dutch Borneo and the Celebes in order to gain control of the Macassar strait passage to the Java sea. From their base at Truk in the Caroline Islands, Japanese amphibious forces landed at Rabaul, New Britain and Kavieng, New Ireland, on Jan. 23, 1942, and on Bougainville in the Solomon's on Jan. 29, 1942. These latter operations made the sea lanes from Australia to the Indies most hazardous.

In the Java sea, the Allied navy, consisting of what U.S., British, Dutch and Australian ships could be scraped together, attempted to stop the Japanese advance. In the battle of Macassar strait on Jan. 23–25, Allied sea forces struck, under cover of darkness, at a Japanese invasion fleet lying off Balikpapan, Borneo, inflicting severe damage and forcing the Japanese to withdraw northward. However, this attack was too late to prevent the Japanese capture of Balikpapan on Jan. 22 by troops which had been landed before the sea battle. (For more extended discussions of the battle of the Java sea and other naval engagements mentioned in this section, see under section V, "The War at Sea," p. 751 fol.)

Aboina and Ceram Islands in the Banda sea were occupied by the Japanese on Feb. 1, 1942.

On Feb. 4, a Dutch-U.S. fleet, consisting of four cruisers and seven destroyers, commanded by Rear Adm. Carel W. F. M. Doorman of the royal Netherlands navy, attempted an attack on another invasion fleet which air reconnaissance had discovered at Balikpapan. The Allied fleet was intercepted by Japanese bombers and forced to turn back. The U.S. cruiser "Houston" and the U.S. light cruiser "Marblehead" were damaged.

Previous agreements had provided that, when the focal point of Japanese attack became the Netherlands Indies, the Allied defensive forces would be commanded by Dutch officers. On Feb. 11, 1942, in compliance with this agreement, Admiral Hart turned over operational command of Allied naval forces to Vice-Adm. C. E. I. Helfrich, royal Netherlands navy. A few days later, General Wavell turned over his command to Lieut. Gen. Hein ter Poorten, royal Netherlands army, and departed for India.

Japanese paratroopers were dropped on southern Sumatra on Feb. 14, one day before Singapore surrendered, and were quickly followed by sea-borne troops. They rapidly overran the Palambang oil fields and forced the Dutch defenders to withdraw to Java.

On Feb. 18, the Japanese seized a Dutch airfield on the island of Bali and on the 20th landed on Timor. Occupation of this latter island completed the southern encir-

clement of Java, cutting its communications with Australia. Also, the seizure of these two islands gave the Japanese air power a base within easy striking distance of Java. Thereafter, the bombing of key points on that island was intensified.

Admiral Doorman led his composite naval force in an attack on a Japanese convoy, bringing reinforcements to Bali, striking the Japanese in Bandung straits on the night of Feb. 19–20. This attack inflicted extensive damage on the Japanese, but the Allied fleet suffered the loss of one Netherlands destroyer, the "Pict Hein," and damage to two Netherlands cruisers, the "Java" and "Tromp" and the U.S. destroyer "Stewart." The U.S. seaplane tender "Langley" was sunk on Feb. 26 while attempting to reach Java with reinforcements of fighter planes.

Admiral Doorman's Allied fleet, now consisting of two heavy cruisers, three light cruisers and nine destroyers, sortied against a superior Japanese force lying off Surabaya on Feb. 27, in an attempt to intercept Japanese convoys closing in on Java. This engagement resulted disastrously for the Allies and marked the end of organized naval resistance in the Netherlands Indies. Two cruisers and two destroyers were sunk and one cruiser damaged. While the Japanese covering fleet suffered some damage, its invasion convoys were untouched.

On Feb. 28 one Allied cruiser and two destroyers were sunk in Sunda straits while attempting to flee the Java sea. Again, on March 1, two cruisers and one destroyer were lost in the same locality. Of the entire Allied fleet, only four U.S. destroyers managed to make their way to Australia by way of Bali strait.

Japanese invasion forces landed at three points on the north Java coast on Feb. 28 and quickly made their way across the island. Reinforcements were landed rapidly until the Japanese strength exceeded 100,000 troops. The defensive efforts of the Allied forces, isolated by the rapid thrusts of the invaders, were quickly dealt with, and on March 9, 1942, Java surrendered. Allied military casualties approximated 18,000 killed, wounded and captured: Dutch 11,300; British 5,600; Australian 300; U.S. 800. No Japanese casualty figures became available.

6. The Tokyo Raid.—On April 18, 1942, the Japanese home islands were raided by 16 U.S. B-25 medium bombers. These planes were transported to within 850 mi. of the Japanese shore on the United States carrier "Hornet," with planes from the carrier "Enterprise" furnishing scouting and fighter cover. Under command of Col. James H. Doolittle, the planes completely surprised the Japanese and dropped their bombs on Tokyo and other industrial cities with little effective opposition. After the raid the planes flew to China, except one which landed in Russian territory, where it crash landed as its gasoline supply was exhausted. Of the 80 crew members, 64 returned to United States control, being aided by friendly Chinese. While the raid had little strategic value, its morale effect in the dark days of 1942 was inestimable. (See Tokyo.)

Meanwhile, Gen. MacArthur had reached Australia March 17, 1942, to find that that continent was being systematically isolated by the Japanese sweep through the Southwest Pacific islands. The Australian port of Darwin on the north coast was heavily raided by Japanese planes on Feb. 19, 1942, and was virtually neutralized. The airport, warehouses, docks and practically every ship in the harbour was destroyed. Advancing from their New Britain and New Ireland bases, the Japanese struck at the northern New Guinea coast, landing at Lae and Salamaua on

March 8, 1942, and pushing the Australian defenders inland on the road to Port Moresby.

B. Allies on the Offensive-Defensive

On May 3, 1942, the Japanese began to occupy Florida Island in the southern Solomon Islands. This advance constituted a threat to the bases which had been established by the United States in the New Hebrides and Fiji Islands as well as New Caledonia, to protect the shipping lanes connecting the United States with Australia. Further, Japanese appearance in the southern Solomons area constituted a direct threat to the northeast coast of Australia, with a probable initial thrust to eliminate Port Moresby, the Allied base on the southeast coast of New Guinea. A United States naval force under Rear Adm. Frank J. Fletcher, consisting of 1 carrier, 3 cruisers and 6 destroyers, initiated on May 4 a plane attack which sank or damaged 12 of the 15 Japanese ships in Tulagi harbour, with a loss of 3 airciaft. On May 5, Admiral Fletcher's flect joined with a task force commanded by Rear Adm. Thomas C. Kinkaid and an additional naval group under the command of Rear Adm. J. G. Grace. The combined fleet of 2 carriers, 11 cruisers (including 2 Australian cruisers) and 15 destroyers struck a Japanese force of 1 carrier, 3 cruisers and 6 destroyers, sinking the carrier and 1 cruiser on May 7. The next day the Allied fleet struck another Japanese force consisting of two carriers, four cruisers and several destroyers, damaging one carrier. The Japanese carrier plane attack on the Allied fleet resulted in the sinking of the United States carrier "Lexington," the U.S. destroyer "Sims" and one other vessel. The United States carrier "Yorktown" was damaged. The Japanese forces withdrew to the north after suffering extensive losses. The battle of the Coral sea, which definitely stopped the Japanese advance, was, in the words of Adm. Ernest J. King, commander in chief, United States fleet, "the first major engagement in naval history in which surface ships did not exchange a single shot."

The battle of the Coral sea marked the beginning of the end of the period of Japanese victories. The setback they suffered there delayed further aggressive action and allowed the Allies to mass strength and assume the offensive.

1. Midway.—Following the battle of the Coral sea, the Japanese decided on an offensive attempt in the central Pacific. However, the United States Pacific command had foreseen the possibility of such a Japanese attempt and

Survivors of the battle of Midway paying their last respects to those who were killed in the action of June 1942

had recalled the carriers with their supporting vessels from the South Pacific. The total United States force consisted of 3 carriers, 1 heavy cruiser, 7 light cruisers, 14 destroyers and 20 submarines. The Japanese forces were picked up several hundred miles southwest of Midway Island (q.v.) on the morning of June 3. The next day another attacking force was developed northwest of that island. On June 5–6, United States land-based and carrier planes hammered the Japanese vessels until they withdrew to the westward in thick weather. The battle of Midway, like that of the Coral sea, was entirely fought by aircraft. Surface vessels did not exchange a shot. It also marked the first decisive defeat of the imperial Japanese navy in 350 years.

2. Guadalcanal.—In July 1942, the Japanese moved a force consisting of troops and labourers to Guadalcanal Island in the Solomon Islands (q.v.) and commenced the construction of an airfield. The Allies immediately recognized that land-based aeroplanes operating from this field would seriously menace the bases in the New Hebrides and New Caledonia as well as Port Moresby in New Guinea.

Immediate steps were taken to eject the Japanese, utilizing forces available in the South Pacific area. On Aug. 7, 1942, the U.S. 1st marine division reinforced, commanded by Maj. Gen. A. A. Vandergrift, made surprise landings on Guadalcanal and Florida Islands. The landings were made with strong naval and air support and met little initial opposition. The airfield on Guadalcanal and Tulagi harbour at Florida Island were seized in the first 36 hours.

The Japanese reacted quickly and on the night of Aug. 9 struck hard at the Allied naval force supporting the operation. A Japanese force of cruisers and destroyers engaged the Allied fleet and, in 30 minutes of intensive activity (battle of Savo sea), sank one Australian and three U.S. cruisers.

The concentration of Japanese forces in the Rabaul area to the north foreshadowed further attempts to lorce the Allies to relinquish the seized islands. On Aug. 24, Allied carrier-based aircraft intercepted a transport convoy about 250 mi. north of Guadalcanal. An intensive bombing attack, in which land-based army and marine planes also participated, inflicted extensive damage, and forced the convoy to turn back to Rabaul. This engagement was named the battle of the eastern Solomons. The Japanese,

however, continued to reinforce their Guadalcanal forces, transporting troops in by night from the near-by islands with light surface craft, and by the end of September had succeeded in moving what amounted to a complete new division into the area. They also continued their attempts to provide naval support to their ground forces, which led to a series of engagements with the Allied naval forces engaged in the same mission. In the battles of Cape Esperance on Oct. 11-12; Santa Cruz Island, Oct. 26; Guadalcanal, Nov. 13-14-15, and Tassataronga on Nov. 30, the Allied sea forces established undisputed naval superiority in the southern Solomons area. Japanese losses were 46 ships of all types sunk or damaged, while Allied losses totalled 1 battleship damaged, 1 carrier sunk and 1 damaged, 3 cruisers sunk and 4 damaged, 11 destroyers sunk and 3 damaged-a total of 24 vessels.

Meanwhile, the land action on Guadalcanal had steadily increased in intensity as the United States marine forces stubbornly resisted the increasing pressure of the numerically superior Japanese. The defense was aided by improved air support and by United States army reinforcements (Americal division) which began arriving Oct. 13. Japanese effort to eliminate the U.S. foothold reached its peak on Oct. 26, when an all-out attack pierced the Allied defense lines and the possession of Henderson field hung in the balance. Allied counterattacks, however, restored the position and defeated the last serious ground offensive effort on the part of the Japanese. During the remainder of 1942, the Japanese forces were steadily pushed back toward the northwestern part of the island. During the period Dec. 18, 1942-Jan. 4, 1943, the U.S. 25th infantry division moved to Guadalcanal. These reinforcements increased the Allied

Supplies pouring onto the beachhead at Guadalcanal after advance landings by U.S. marines in 1942. The army and marine corps were preparing for joint action in wiping out remaining Japanese resistance on the ideal

combat strength to two army divisions and one U.S. marine regiment, the 1st marine division being withdrawn in December after more than four successive months of intensive combat. Offensive operations continued through Jan. 1943, narrowing and compressing the Japanese defensive positions. During the first week of February, Japanese light surface craft began evacuating the small forces remaining, and on Feb. 8, 1943, the last Japanese pocket of resistance was eliminated and Guadalcanal was firmly in Allied hands.

3. Papua.—Even though the Japanese were heavily engaged in their attempt to hold Guadalcanal, they were determined to continue the push toward Australia. The battle of the Coral sea had frustrated the initial Japanese attempt at a sea-borne invasion of the southern coast of New Guinea. Their next effort was an overland advance from New Guinea's northeast coast across the Owen Stanley mountains. Port Moresby, with its excellent harbour on the south coast, was the immediate Japanese objective. Its possession would provide the Japanese with a potential invasion base within 350 mi. of the Cape York peninsula in Australia.

On July 21–22, 1942, Japanese invasion forces, with a strength of 4,400, landed at Buna, Gona and Sanananda on the northeast coast. Additional troops poured in until by Aug. 13 the Japanese strength totalled more than 11,000, and the drive toward Port Moresby began. Australian soldiers in greatly inferior numbers put up a desperate resistance but were slowly pushed back across the summit of the precipitous Owen Stanley range and down the southern slope to within 30 mi. of Port Moresby by Sept. 14. At this point, logistical difficulties coupled with stiffened resistance by the Australians, who had received timely reinforcements, halted the Japanese advance.

Additional Japanese forces were landed at Milne bay

on the eastern tip of New Guinea, on Aug. 25, with the intention of enveloping Port Moresby from that direction. The landing forces suffered heavy losses from strafing by Allied planes and after three days of stiff fighting were forced to re-embark. This was the first time that a Japanese force, which failed to accomplish its mission, had ever been evacuated.

During the two weeks' stalemate, Sept. 14–28, while the Australians held the main Japanese forces east of Port Moresby, the Allied air forces had continuously attacked the tortuous Japanese supply line stretching over the mountains to Buna and Gona. Under this heavy pounding, the Japanese supply system had broken down completely. The half-starved Japanese were in no condition to resist the Australian attack, which started on Sept. 28, and they began a hasty withdrawal, closely pursued by the Allies.

Reinforcements of U.S. troops (elements of the U.S. 32nd infantry division) reached Port Moresby on Sept. 28, and plans were made for an offensive designed to eliminate the Japanese in the Papuan peninsula. While the Australians drove them back along the mountain trail, U.S. troops undertook a wide envelopment on the east flank, attacking

in the vicinity of Buna.

The Australian 7th division, reinforced, steadily followed up the retreating Japanese, who made only a brief stand in front of Kokoda, which was captured on Nov. 3, and then retreated to the coast without offering battle. By Nov. 18, the Japanese had been penned up in isolated pockets at Gona, Sanananda and Buna. Because of Japanese preoccupation with the struggle on Guadalcanal, no reinforcements were reaching their forces in Papua. However, the perimeter defenses of Japanese pockets along the coast were skilfully adapted to the jungle terrain and were garrisoned by determined troops who would fight to the death before surrender. The U.S. attack to reduce the Buna beachhead began Nov. 19. It required 45 days of constant, determined attack by 9,000 U.S. soldiers before the Buna pocket with its defending garrison of 2,200 Japanese was finally eliminated on Jan. 2, 1943.

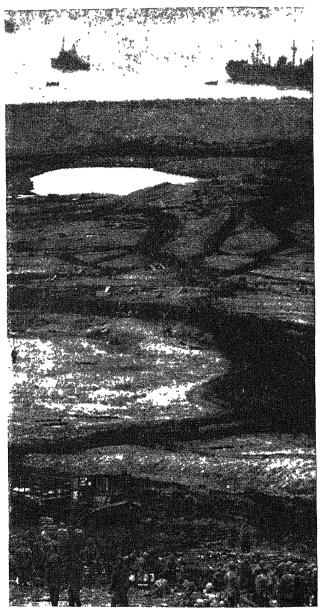

Meanwhile, the Australians had pushed on toward the much more weakly held Gona pocket (estimated garrison was 650 Japanese). A co-ordinated attack launched on Nov. 28 smashed the Gona defenses and eliminated the

pocket by Dec. 3, 1942.

The two forces (Australian 7th division and elements of the U.S. 32nd and 41st infantry divisions) then joined up to wipe out the Sanananda perimeter, the strongest of the three being garrisoned by an estimated 5,000 Japanese. The attack, which commenced Jan. 4, 1943, was resolutely pushed by the Allied forces; and all resistance was overcome on Jan. 23.

The Papua campaign cleared the coast of New Guinea of Japanese as far north as Gona and, together with the capture of Guadalcanal, removed the threat of a Japanese invasion of Australia. The Allied air force, though limited in strength, had been skilfully employed to assist the campaign. The destructive raids on Japanese lines of communication had forced the Japanese to resort to submarines and air-drops to supply the fanatical defenders of their isolated beachhead pockets. In addition, the air transport, supply and evacuation of Allied troops had added materially to the handicaps imposed by limited communication facilities in the undeveloped jungles of New Guinea.

4. Aleutians.—Simultaneously with their thrust across the mid-Pacific which culminated in the battle of Midway, the Japanese also threatened the Aleutians. Their immediate

U.S. forces establishing their beachhead on Attu Island in the Aleutians May 11, 1943

objective appeared to be Dutch Harbor, which was attacked by bombers June 3, 1942. Repeated attacks by U.S. aircraft commencing June 4, 1942, despite most unfavourable weather conditions, inflicted heavy losses and forced the withdrawal of this force. Subsequent to this attack, it was discovered that Japanese forces had occupied the Aleutian Islands of Kiska, Attu and Agattu. The occupation of these barren islands was of little strategical importance, provided defensive measures were taken to prevent a build-up in the Japanese strength which would permit further infiltration along the island chain. Therefore, immediate provision was made to bring the Japaneseheld islands within effective range of combat aircraft. U.S. troops were landed on Adak Island on Aug. 30, 1942, and immediately commenced the development of advanced airfields, from which the first mass air raid against Kiska was launched on Sept. 14, 1942.

In order to facilitate the air attacks further, a U.S. task force occupied Amchitka Island, 70 mi. west of Kiska, on Jan. 11, 1943. This action effectively cut the Japanese

supply lines and ensured that there could be no further development of Japanese strength in that area. The air blockade proved so effective that the Japanese ceased all attempts to supply their garrisons by surface ships, in March 1943.

The extreme shortage of ships, aeroplanes and trained troops, coupled with the more pressing requirements needed to maintain the Allied position in other areas, precluded any attempt to recapture the occupied islands at this time. After the successful completion of the operations on Guadalcanal and in Papua, a limited amount of personnel, matériel and shipping were made available to contest the Japanese occupation of the Aleutians. The main Japanese garrisons were located on Kiska, with an estimated strength of 7,800, and Attu, occupied by 2,200. Military operations on either island presented tremendous problems because of climate, distance from suitable staging facilities and extremely rough and difficult terrain. The decision was to bypass Kiska, where intelligence reports indicated the Japanese expected an attack, and assault Attu. On May 11, the U.S. 7th infantry division, with strong naval and air support, landed on Attu and fought its way across the island, in three weeks of desperate fighting, to encircle the Japanese at Chichagol harbour. On May 31, 1943, the campaign ended with the annihilation of 2,350 Japanese defenders. U.S. casualties totalled 2,900, including 513 dead. Nonbattle casualties accounted for 40% of the above total.

The capture of Attu sealed off Kiska and rendered the Japanese position on the latter untenable. When a U.S. task force made a combat landing on the west coast of Kiska on Aug. 15, it discovered that the Japanese had evacuated by submarine under the protection of bad weather and fog. The threat to Alaska and the Pacific northwest coast had been first checked and then eliminated.

These new bases in the western Aleutians placed the Japanese northern Kuriles within effective range of heavy bombers. Throughout the remainder of the war, air attacks were made on these islands, especially on the main base at Paramushiro, whenever weather conditions permitted. The attacks possessed a high degree of deceptive value and contributed to the general attrition of Japanese military strength.

Road Back to Tokyo

The successful termination of the fight for Guadalcanal. coupled with Allied success in the naval battles of the South Pacific and Midway, marked the first step on the long road back to Tokyo. In itself, the battle of Guadalcanal was strategically defensive in character, being fought to protect the United States-Australia lines of communication. The same was true of the Papua campaign. Success in these struggles had gained for the Allies footholds from which to launch their next attack on the Japanese defense perimeter in the Pacific.

From Dec. 7, 1941, until early 1943 the Japanese had held the initiative. The Allies had little opportunity to plan operations, being forced to use their limited means wherever and whenever Japanese activities dictated.

At the Casablanca conference in Jan. 1913, the United States and British chiess agreed that there must be increased supplies for China. Strategic plans for operations in the South and Southwest Pacific were also drawn up. Even though preoccupied with the task of eliminating Germany from the war, the needs of the Pacific as to troops, matériel, ship tonnage, naval dispositions, etc., were given consideration.

In March 1943, commanders and staff officers of the Central, South and Southwest Pacific areas were called to Washington, D.C., to co-ordinate their theatre plans with the over-all strategical plan which guided the Allied prosecution of the war. This conference resulted in developing a plan which included allotment of available resources, definition of command structures and a statement of operational objectives. It was subsequently approved by the joint chiefs of staff and furnished guidance to the field forces for the immediate future.

In April 1943, Gen. Joseph Stilwell and Gen. Claire L. Chennault were called to Washington to give first-hand information regarding conditions in China to a conference of United States and Great Britain heads of state and the combined chiefs of staff. Field Marshal Sir Archibald Wa vell presented the situation in India and Burma while Dr. T. V. Soong pleaded for more aid to China. At this conference, an integrated plan for logistical support and military operations was evolved to guide future Asiatic activities.

At the Trident conference in Washington, May 12-25, 1943, there was further development of the logistic and operational plans designed to aid China.

The Quadrant conference at Quebec, Aug. 1943, resulted in the formation of the southeast Asia command under Adm. Louis Mountbatten, with General Stilwell as deputy commander. The latter retained command of the United States-China-Burma-India theatre as well as his position as deputy to Generalissimo Chiang Kai-shek, who continued in command of operations in China. The royal air force and United States army air force combat units operating against Japanese-held Burma from bases in India were combined into the eastern air command under Maj. Gen. George E. Stratemever. U.S. army.

Also at the Quadrant conference, the strategic plans for the Pacific offensive against the Japanese were developed. General MacArthur's operations along the north New Guinea coast were to continue on a schedule which contemplated that he would reach the Philippines by the late fall of 1944.

The South Pacific forces, both army and navy, were commanded by Adm. William F. Halsey, United States navy. While retaining operational autonomy, these forces were under the strategical control of General MacArthur. Their axis of advance through the Solomons would protect the eastern flank of the New Guinea forces and aid in the ultimate isolation of the Japanese stronghold in the Rabaul-Kavieng area.

Adm. Chester W. Nimitz, United States navy, commanding Pacific ocean area, was to strike across the central Pacific through the Gilbert, Marshall and Marianas Islands with the objective of securing a foothold in the Ryukyus in the spring of 1945. Adm. Ernest R. King, chief of naval operations, United States navy, accurately forecast at that time that a major collision with the Japanese navy, resulting in a decisive defeat for the latter, would occur during either the Marianas or Philippine phase of this advance.

Another major development of the Quadrant conference was the proposed air plan of Gen. H. H. Arnold, chief of the United States army air forces, to soften Japan by extensive B-29 Superfortress bombing raids from bases in China and the Marianas. This proposal was later approved and led to the formation of the 20th air force, which operated as a strategic air force under the direction of the U.S. joint chiefs of staff.2

¹ Gen. Douglas MacArthur did not attend, being represented by a senior staff

officer.

2 While the combined U S -British chiefs of staff controlled the broad strategic distribution of resources to the various theatres, the U S joint chiefs of staff directed actual operations in the Pacific.

1. After Guadalcanal.—Subsequent to the elimination of the Japanese at Guadalcanal and Buna, there ensued a lull in sea and ground activities, while supplies, ships and troops were being augmented and regrouped for future operation. However, large-scale and effective operations were carried on by the Allied air forces, which stifled Japanese attempts to reinforce and supply their garrisons in the outer ring of their Pacific defenses.

By July 1, 1913, the Allied forces in the Southwest Pacific consisted of four U.S. and six Australian divisions under General MacArthur's control. In the central Pacific, Admiral Nimitz had nine U.S. army and marine divisions, the U.S. 7th air force and the U.S. Pacific fleet. With this force, the Allies advanced to the threshold of the Philippines within a year.

On June 22–23, 1943, a U.S. amphibious thrust from the newly won New Guinea base easily secured the small Kiriwina and Woodlark Islands to the east of New Guinea. Airfields were quickly constructed, which permitted the rapid interchange of fighter aircraft between the Solomons and New Guinea, as the situation demanded.

The South Pacific forces, operating from Guadalcanal, initiated operations to secure New Georgia Island on June 30, 1943, by landing on near-by Rendova Island to secure artillery positions which would support the main attack. The initial landings on New Georgia by the elements of two U.S. divisions (37th and 43rd) met slight resistance. However, opposition stiffened and it was only after the attacking forces had been reinforced by the U.S. 25th division that the main objective, Munda airfield, was captured on Aug. 5, 1943. This series of operations in the Solomons was concluded when the U.S. 14th corps, commanded by Maj. Gen. Oscar W. Griswald, captured Vella Lavella Is land on Oct. 9, after bypassing Kolombangara Island, which was strongly garrisoned by the Japanese. The cap ture of Vella Lavella forced the Japanese to evacuate Kolombangara, which was occupied without resistance.

Allied forces in New Guinea had not been idle. Supported by a U.S. regimental combat team, Australian troops advancing overland had captured Salamaua on Sept. 11, 1943. While the Japanese garrison at Salamaua still offered strong resistance, additional Australian troops

made an amphibious landing just east of Lae, 30 mi. north of Salamaua, on Sept. 4. This landing was followed by the drop of a U.S. parachute regiment, the next day, to seize the Nadzab airport, about 20 mi. northwest of Lae. An Australian division was immediately moved by air to Nadzab and after some arduous and difficult combat occupied Lae on Sept. 16.

Without pausing to reorganize, MacArthur quickly moved his haid-fighting Australians on Finschhafen. Landing near the town on Sept. 22, the Australians secured it on Oct. 2. The remarkable achievements of the limited Allied air force in neutralizing Japanese supply lines and ainfields, as well as transporting and supplying the Allied ground troops, had contributed materially to the success of the campaign. The considerable Japanese forces which had fled inland to escape the Allied attacks along the coast continued to offer strong resistance until Feb. 1944.

Keeping step with General MacArthur's advance, the Allied troops in the Solomons pushed forward. New Zealand forces seized two islands in the Treasury group, northwest of Vella Lavella, on Oct. 23, 1943. After successful diversionary landings on Choiseul Island, the United States 3rd marine division struck the western coast of Bougainville Island at Empress Augusta bay on Nov. 1, 1943. No attempt was made to occupy the entire island. The planned objective was to secure a lodgment of sufficient size to permit the building of airfields which were within fighter range of Japanese concentrations in the Rabaul-Kavieng area. Two United States army divisions, the 37th and the Americal, reinforced the initial landing force during the ensuing six weeks. Supported by a naval task force under Admiral Halsey, which completely blanketed the Japanese sea and air strength at Rabaul, the beachhead was successfully defended against a series of desperate Japanese counterattacks. These attacks culminated in an all-out assault on the Allied defense lines in March 1944 which was beaten back with heavy and irreplaceable losses to the Japanese.

2. Central Pacific.—In the fall of 1943, the United States sea and land forces under Admiral Nimitz, commander in chief, Pacific ocean area, initiated operations designed to

U.S. marines on Tarawa preparing to attack Japanese positions from their bitterly-won beachhead. The 76-hour battle for this coral atoll in the Gilberts in Nov. 1943, was one of the bloodiest in the history of the marine corps to that date

carry out the directive which had been evolved in the Quadrant conference at Quebec the preceding August.

The first objective was to gain control of the Gilbert Islands (q.v.) group. The strategic directive originally issued by the joint chiefs of staff called for simultaneous assaults on Tarawa and Nauru Islands. Upon representations by Admiral Nimitz that the distance between the two islands was so great that the covering naval forces would be exposed to the danger of defeat in detail by Japanese forces based in the Marshall Islands, Makin Island was substituted for Nauru. On Nov. 21, 1943, U.S. forces made simultaneous landings on the two islands. Elements of the 27th division landing on Makin Island met stubborn but ineffective opposition from the relatively weak Japanese garrison. The U.S. 2nd marine division landed on Tarawa Island, where the much stronger garrison fought with grim determination. The defense was aided by the restricted area of the island which precluded the employment of large numbers of attacking troops. Skilfully constructed defensive works protected by mines and underwater obstacles commanded the practicable landing areas. From these defensive positions an intense cross fire of automatic weapons could be brought to bear on the landing forces. The positions were taken by direct infantry assault under the cover of a shattering air and naval bombardment. The losses of the attacking forces were so heavy that Tarawa may be considered one of the bloodiest battles in U.S. history. Its successful outcome constituted a memorial to the unflinching courage of the U.S. fighting man. When the island was finally secured on Nov. 24, the casualties of the United States and marine division totalled 913 killed and missing and 2,037 wounded.

The next blow in this central Pacific advance fell on Kwajalein atoll in the Marshall Islands (q.v.). Preceded by an intensive two-day air and naval bombardment which threw 14,500 tons of high explosives, a composite U.S. army and marine landing force struck the islands on Jan. 31, 1944. The U.S. 7th infantry division landed on Kwajalein Island in the southern part of the atoll while the U.S. 4th marine division attacked the islands of Namur and Roi at the northern tip. By Feb. 9, all resistance had been overcome. Operations to secure the Marshall Islands were completed on Feb. 22, when Eniwetok atoll was secured by amphibious U.S. marine and army forces, dispatched from Kwajalein, which had landed on Feb. 19, 1944. U.S. casualties in these operations totalled 2,016 killed, wounded and missing. Estimated Japanese casualties were approximately 9,000.

Control of the Marshall Islands brought the great Japanese naval and air base at Truk within effective bombing range. It was thus effectively neutralized until further U.S. advances into the Caroline Islands could definitely isolate it and render it totally useless.

3. Southwest Pacific.—After the capture of Finschafen, further advance westward along the New Guinea coast could not be attempted until control of the Vitiaz and Dampier straits, separating New Britain from New Guinea, had been obtained. This necessitated mounting operations to secure the western end of New Britain Island, including the extensive air base at Cape Gloucester. A reinforced cavalry regiment was landed on the southern shore of New Britain, near Arawe village, on Dec. 15, 1943, followed 11 days later by the landing of the U.S. 1st marine division in the Cape Gloucester area. This force occupied the aerodrome on Dec. 30 and immediately struck south to link up with the Arawe force. Mainly because of terrain difficulties rather than Japanese resistance, it was not until mid-March that these joint operations secured western

New Britain and made the straits safe for the passage of Allied vessels.

Prior to the completion of the western New Britain operations, an amphibious expedition, consisting of a regimental combat team from the U.S. 32nd division, pushed westward 100 mi. from Finschafen to land near Saidor on the north New Guinea coast on Jan. 2, 1944. By Jan. 7, an air strip was in operation, and Allied air power intensified its interdiction of the Japanese supply lines to the remaining New Guinea garrisons.

Allied possession of the Saidor-Cape Gloucester area isolated the Japanese-Kavieng-Rabaul concentrations from the west. The airfields captured or constructed permitted the basing of Allied planes within 300 mi. of Rabaul. Meanwhile, the Allied South Pacific forces under Admiral Halsey had arrived within 125 mi. of Rabaul to the eastward when on Feb. 15, 1944, a U.S. force landed in the Green Islands, meeting only minor opposition. This operation, coupled with the activities of U.S. naval forces in the central Pacific, made any Japanese attempts to supply their beleaguered forces from the east or northeast extremely hazardous.

On Feb. 29, 1944, elements of the U.S. 1st cavalry division landed on Los Negros in the Admiralty Islands to conduct a reconnaissance in force. The initial success of this landing was followed up by the commitment of the remainder of the division. The major Japanese aerodrome was secured and held against fanatical counterattacks. By April 17, 1944, organized Japanese resistance on the main island of Manus had ceased. U.S. casualties were 321 killed, 1,189 wounded and 4 missing. The Japanese lost 3,280 killed and 75 captured.

The capture of the Admiralties, an operation which General MacArthur referred to as "putting the cork in the bottle," placed Allied forces squarely across Japanese supply lines to the Bismarcks from the north and northwest, leaving 100,000 of their seasoned troops in isolated impotence. As an offensive base for Allied sea and naval power, the islands controlled the Bismarck sea and protected Allied advances toward the Philippines. Manus Island, with its protected Seeadler harbour anchorage, became the major Allied naval supply base in the Southwest Pacific.

The next move westward along the New Guinea coast involved a leapfrog advance of more than 400 mi. On April 22, 1944, U.S. forces (24th, 32nd and 41st divisions), landing on a front of 175 mi., secured beachheads at Aitape, Hollandia and Tanahmera bay. The operation came as a complete surprise to the Japanese, and the landings were practically unopposed. These landings were beyond the effective range of army fighters. Therefore, their air support was provided from naval carriers, many of which had been borrowed from Admiral Nimitz' Pacific fleet and attached to Adm. Thomas C. Kinkaid's Southwest Pacific forces. By April 30, Allied forces had captured the three excellent airfields which were put into immediate use as Allied air bases. Simultaneously, an Australian division was landed near Madang and advanced overland toward Wewak and Aitape. This force reached Hansa bay on June 15, 1944.

The advance westward continued without pause with the landing on May 17, 1944, of elements of the U.S. 41st division at Arara, 125 mi. west of Hollandia. A few days later, on May 21, a regiment of this same division landed on Wakde Island, just off shore from Arara, and captured its airstrip. Meanwhile, the force left on the main island

of New Guinea pushed the perimeter of the initial Arara beachhead westward to include Maffin bay.

Without delaying to regroup, Allied forces (U.S. 41st division) pushed on westward 200 mi. under naval and air cover to land on Biak Island, which controlled the entrance to Geelvink bay, on May 27, 1944. The island was taken, despite the fierce resistance of the garrison of 8,000 Japanese, on June 20. The three airstrips captured in this operation were quickly placed in operational condition, furnishing Allied bases for air strikes against Japanese concentrations in the Moluccas and Celebes. After Allied air power had hammered for three weeks at Noemfoor Island, a U.S. combat team supported by paratroops landed on July 2 and seized an airstrip in three hours, completing the capture of the island three days later. Possession of that island, 100 mi. west of Biak, gave necessary depth to Allied air deployment in the area and provided advanced bases which permitted deeper penetration of the Japanese-held Pacific island empire.

On July 30, 1944, elements of the U.S. 6th division effected another surprise landing at Sansapor, on Vogelkop peninsula, at the extreme western end of New Guinea. Resistance was slight, despite the presence of 18,000 Japanese troops in the area. This operation marked the strategic end of the New Guinea campaign which had brought the Allied forces 1,200 mi. closer to the ultimate objective, Tokyo. The technique employed resulted in the isolation of more than 60,000 Japanese along the north New Guinea coast. This force was so disorganized and separated by the successive leapfrog landings at key points that it was incapable of offering any co-ordinated and unified resistance. Allied air and sea power completely controlled the Japanese supply lines to these bypassed units, leaving them to starve and die in the jungles.

A prime factor in the Allied successes in the Southwest Pacific was the brilliant and efficient employment of the limited Allied naval and air resources allocated to the area. The co-ordinated teamwork of the land, sea and air power available did much to overcome the matériel and personnel shortages, as also did the practice of combining naval and air resources of the various Pacific areas for certain operations. Each operation attempted was preceded by air attacks. Initially, the U.S. 5th air force under Lieut. Gen. George C. Kenney in the Southwest Pacific and the U.S. 13th air force, commanded by Brig. Gen. Nathan F. Twining in the South Pacific, operating in close unity with their respective Australian and New Zealand air forces, functioned as separate but co-operative commands. On June 25, 1944, these two air forces, while maintaining their separate identities, were merged together with the royal Australian air force and royal New Zealand air force into the Far East air forces, commanded by General Kenney. Maj. Gen. Ennis C. Whitehead succeeded to the command of the U.S. 5th air force, while the U.S. 19th air force was commanded by Maj. Gen. St. Claire Streett, who had succeeded General Twining. The combined air forces swept the Japanese from the skies and struck far to the westward against Japanese supply bases and airfields in the Celebes, Timor, Java, Sumatra and Borneo. By these attacks, the Japanese were seriously hampered in their attempts to supply and control their widely separated island garrisons and were prevented from concentrating their forces to meet the Allied thrusts.

4. The Marianas.—The lull in ground operations in the central Pacific area, which followed the capture of the Marshall Islands, was broken on June 15, 1944, when an

amphibious force which consisted of the United States and and 4th marine divisions and the U.S. 27th infantry division landed on Saipan Island in the Marianas Islands (q.v.). The attacking forces forged ahead despite stubborn opposition from the garrison consisting of two Japanese divisions. The island was secured on July 9, after 25 days of extremely difficult combat. The prize of this operation was possession of the well-developed Aslito airstrip in the southern portion of the island.

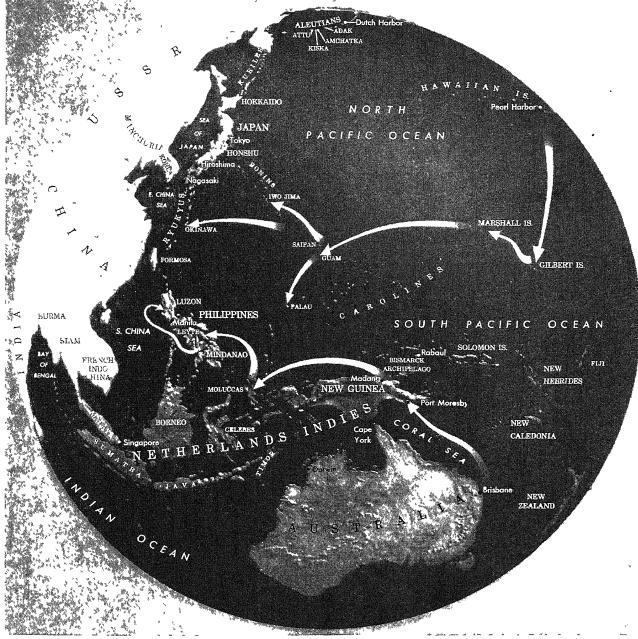

The Japanese fully recognized the significance of this thrust into the western Pacific and took immediate steps to counter it. On June 19 their carrier planes hit the United States naval forces supporting the landing operations and, in the terrific aerial battle which ensued, lost 402 aircraft as against 27 planes lost by the U.S. forces. In addition, one United States battleship and two carriers suffered slight damage. The Japanese fleet fled toward the Philippines, pursued by the United States carrier fleet commanded by Vice-Adm. Marc A. Mitscher. On June 20, United States planes located the fleeing Japanese vessels and sank one carrier and two tankers. In addition, three Jap carriers, one battleship, three cruisers, three destroyers and a tanker suffered damage. This was the third decisive naval victory for the Allied sea power that was fought entirely by carrier planes. Like the battles of Coral sea and Midway, the surface vessels involved did not exchange a shot. The U.S. armada, assured of complete control of the Marianas waters, returned to support the attack of the land forces.

On July 24, 1944, the U.S. 2nd and 4th marine divisions landed on the small island of Tinian, lying approximately three miles south of Saipan. The landing was supported by heavy artillery fire from Saipan and met little initial resistance. The island was captured after 9 days of fighting in which U.S. casualties were relatively light—195 killed, 1,526 wounded and 24 missing—as compared with 5,745 counted Japanese dead.

On June 21, 1944, a landing force, which consisted of the United States 2nd marine division reinforced the U.S. 77th infantry division, landed on Guam (q.v.), to reconquer that former United States possession which had been in Japanese hands since Dec. 11, 1941. Because of the intensive 17-day air and sea bombardment which preceded the landing, there was little initial resistance. However, when the landing forces had advanced beyond effective range of the naval support, the Japanese resisted stubbornly. The island was fully secured on Aug. 10, after 20 days of combat during which Japanese casualties were 10,693 killed and 98 captured. United States forces lost: 1,288 killed, 5,648 wounded and 145 missing.

Before these operations to capture the Marianas were complete, United States forces had begun the construction of heavy duty airfields, which would be bases for the strategic bombing of the Japanese home islands by the newly developed Superfortresses. In the meantime, the U.S. 7th air force, under Maj. Gen. Robert W. Douglass, was already conducting bombing operations against the Japanese outposts of Iwo Jima and Chichi Jima in the Bonin Islands.

Changed conditions which resulted from the Allied successes in the Pacific made it necessary at this time to change the command set-up in the area. On Aug. 1, 1944, the army forces in the Pacific and South Pacific areas were consolidated into one command as the United States army forces, Pacific ocean area, under Lieut. Gen. Robert C. Richardson. The over-all command remained under Admiral Nimitz as commander in chief, Pacific ocean area. At the same time, all United States army air forces in

The Pacific theatre of operations, 1941-45

the area, except the strategic U.S. 20th air force, were combined to form the United States army air forces, Pacific ocean area, under the command of Lieut. Gen. Millard F. Harmon.

The U.S. 20th air force remained under the direct command of General Arnold, commanding general, United States army air forces, with General Harmon as deputy commander to supervise field operations.

The next step westward in the central Pacific area was aimed directly at the Philippines. On Sept. 15, 1944, a joint landing force struck the western Carolines with the United States 1st marine division landing on Peleliu Island, while the 81st infantry division went ashore on near-by Angaur Island two days later. The operation was supported by the greatest naval armada ever assemble. In United States history to that date; more than 800 vessels were actively engaged in direct support, neutralizing far-flung Japanese bases which might contribute to

the defense.

Angaur Island was rapidly overrun, being practically secured by Sept. 20. Initial progress on Peleliu Island was satisfactory also but slowed down when the attacking forces reached the main defensive positions near the centre of the island.

This was largely because of the Japanese reinforcements transported in barges from the heavily garrisoned island of Babelthuap to the north. The island was fully secured by Sept. 30, 1944, in spite of the difficulties of heavy resistance and rough terrain.

5. Morotai.—Simultaneously with the operations in the western Carolines, MacArthur's Southwest Pacific forces made their next jump. On Sept. 15, 1944, the United States 31st infantry division landed on Morotai Island in the Moluccas.

The island was seized against only slight ground opposition while the far eastern air force effectively neutralized the main Japanese airfield on Halmaheira Island to

the south. Morotai, located 350 mi. south of the Philippine island of Mindanao, was a logical steppingstone on the move northward. Also, as an air base it protected MacArthur's western flank from attacks by Japanese concentrations in the Celebes and Netherlands Indies.

6. Return to the Philippines.—On Sept. 12, 1944, planes from Admiral Halsey's 3rd fleet struck heavy blows in the central Philippines. This operation, which was carried out to cover the Allied landings in the western Carolines and on Morotai, developed weaknesses in the Japanese dispositions. Admiral Halsey immediately recommended the cancellation of projected attacks against Yap, Mindanao and other islands to the south in favour of an early attack against Leyte Island in the central Philippines. Admiral Nimitz approved the recommendation and offered General MacArthur the forces which were at the time loading in Hawaii to strike Yap. In two days, General Mac-Arthur revamped his plans and notified the joint chiefs of staff that he was ready to strike Leyte on Oct. 20 instead of Dec. 20 as originally planned. The message from General MacArthur reached the joint chiefs of staff at Quebec, Canada, where they were assembled for the Octagon conterence with the British. In 90 min. the change in schedule was approved.

(a) Leyte.—On Oct. 20 as scheduled, the United States 10th and 24th corps of the 6th army (Gen. Walter Krueger commanding) landed on the east coast of Leyte, following a heavy drumfire, naval bombardment that battered down Japanese resistance. The naval armada which transported the landing forces consisted of more than 800 vessels, including 6 battleships and 18 escort carriers. In addition, the United States 31d fleet was ready to counter any attempt by Japanese naval forces to oppose the landings.

The ground troops pushed rapidly inland and met little opposition from the Japanese defending forces, who were demoralized by the preparatory air and sea bombardment. After three days' advance, General MacArthur directed the forces ashore to hold their ground until the outcome of the impending naval battle was determined.

The Japanese committed the major portion of their naval force in an effort to drive U.S. troops out of the Philippines. The Japanese Singapore fleet, under Adm. Kurita, struck eastward in two forces, one south of Leyte through Surigao strait, the other to the north through San Bernardino strait, against the 7th fleet. At the same time, a third Japanese fleet sailed south from the Japanese main islands to engage the 3rd fleet. On Oct. 24-26, in three almost simultaneous engagements (grouped as the battle for Leyte gulf), the Japanese navy suffered another decisive defeat. The safety of the land forces on Leyte was assured.

The forces on Leyte resumed their advance along two main axes. While the 24th corps under Maj. Gen. J. R. Hodge struck straight westward and drove the defending forces into the mountains, the 10th corps, commanded by Maj. Gen. F. C. Sibert, pushed on Limon on the north coast, aided by short amphibious operations. Seven U.S. divisions (7th, 24th, 32nd, 77th and 46th infantry, 1st cavalry and 11th air-borne divisions) were assembled on Leyte by Dec. 1, 1944. Five airfields were in operation and everything was set for the final push on Ormoc, the Japanese stronghold and supply base on the west coast. Meanwhile, the determined efforts of the Japanese to reinforce their Leyte garrison with troops from other Philippine islands had resulted in a substantial increase in effective strength. This was accomplished in the face of staggering

losses in shipping, personnel and supplies, inflicted by Allied land and carrier planes. The Japanese hercely resisted the advance down the Ormoc valley from the north. On Dec. 7, the United States 77th infantry division, which was transported by water from Tarragona on the east coast of Leyte to the west side of the island, landed south of Ormoc and in four days captured the town and large quantities of supplies. Although the capture of Ormoc sealed the fate of the Japanese defenders, they continued to resist until the end of December.

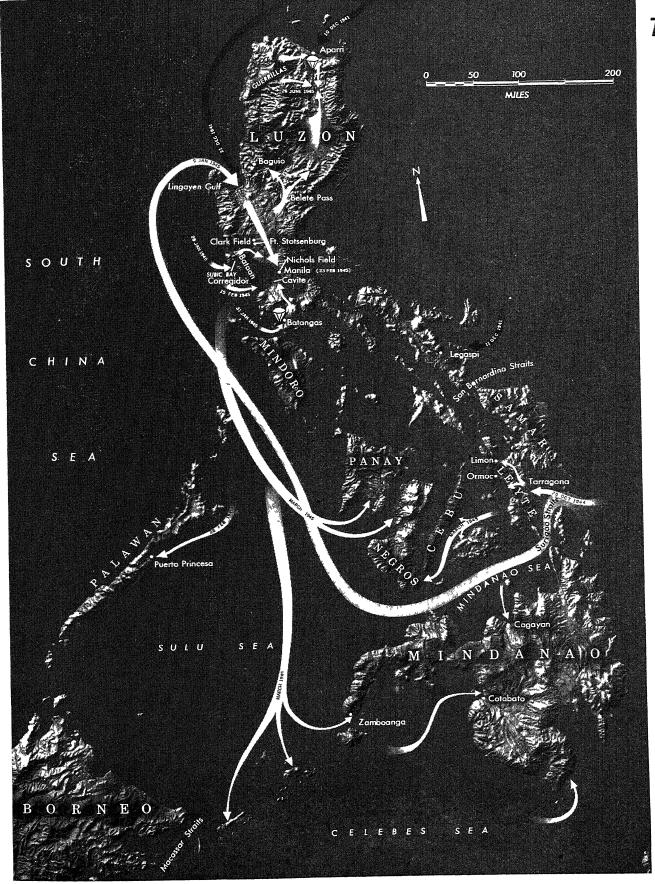

(b) Luzon.-On Jan. 9, 1945, the United States 6th army assaulted Luzon, landing at the head of Lingayen gulf. On the first day, 68,000 troops had landed and gained possession of a beachhead 15 mi. long and 11/2 mi. deep. The amphibious assault forces had assembled off the east coast of Leyte and sailed westward through the Surigao strait, which separated the islands of Leyte and Mindanao. Throughout their movement northward, traversing the Mındanao, Sulu and North China seas, all precautions possible to deceive the Japanese as to disposition and ultimate destination were undertaken. Land-based and carrierbased aircraft blanketed the skies over Luzon to prevent any Japanese attempts at air reconnaissance. All activities, air, naval and guerrilla, were directed toward creating the impression that the impending operations were directed at southern Luzon.

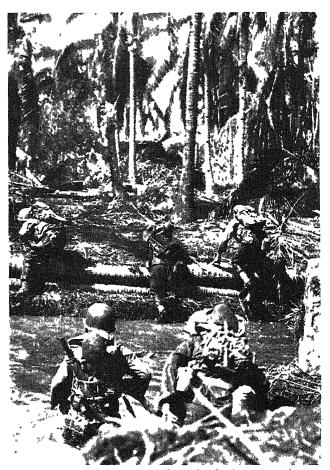

Little opposition to the landing was met, because of the inability of the Japanese to concentrate their forces with sufficient rapidity. While the assault forces were en route, U.S. air attacks had been directed against Japanese lines of communications. Coupled with these air attacks were the increased guerrilla sabotage operations against railroads, bridges and tunnels. These activities aided materially in immobilizing the dispersed and misplaced Japanese troops.

During the three weeks following the landing, U.S. forces pushed steadily southward across the central plain of Luzon. Strong forces were deployed to contain the large Japanese troop concentrations in the mountainous terrain to the east and north of the zone of advance. The only serious Japanese resistance was encountered on the front of these forces and in the vicinity of Clark field and Fort Stotsenburg, where broken terrain favoured the defenders. On the main front, Japanese troops were committed to action piecemeal as they arrived from the south and were defeated in detail.

On Jan. 29, 1945, elements of two United States infantry divisions (the 38th and 24th) landed on the west coast of Luzon, near Subic bay, and drove eastward against light opposition to cut off Bataan peninsula and thus prevent the Japanese from making the same use of it as General MacArthur had three years previously. This advance pushed through the mountains of western Luzon with unprecedented speed and by Feb. 2 had linked up with elements of the 6th army on the north shore of Manila bay.

On Jan. 31–Feb. 3, U.S. forces (elements of the U.S. 11th air-borne division) made a combined amphibious-air-borne landing in Batangas, south of Manila, and immediately pushed on Cavite. On the latter date, advanced elements of the 6th army reached the northern outskirts of Manila. On Feb. 6, the U.S. forces from Batangas had reached Nichols field in the southern part of the city. Although attacked from all landward sides of the city, the Japanese garrison fought bitterly in a house-to-house defense, until their final elimination on Feb. 23.

Fording a tank trap laid for U.S. forces by the Japanese 14th army in its retreat across Leyte. Invasion of the island in Oct. 1944 constituted a critical threat to Japanese supply lines and dogged resistance was offered in its defense

Meanwhile, operations designed to open Manila bay were initiated when a landing force, consisting of troops of the U.S. 38th division, seized the tip of Bataan peninsula on Feb. 15. On the following day, a parachute regiment dropped on Corregidor and at the same time an amphibious force assaulted the shore. After two weeks of vicious fighting the island was secured, and Manila bay was opened.

An important minor operation was the seizure in late February of Puerto Princesa peninsula on Palawan Island, with its two airfields. Aeroplanes based on these fields were able to control a major portion of the South China sea, disrupting Japanese communications with Malaysia and Burma.

During March 1945, landings were made on other major islands in the Philippines, including Mindanao, Panay, Cebu and Negros. Meanwhile, on Luzon, the 6th army drove north and east from the central Luzon plain against the mountain strongholds of the one remaining Japanese force of consequence in the vicinity of Baguio and Balete pass. At the same time, other troops cleared the area southeast of Manila, reaching the eastern shore of Luzon on May 13, 1945. These operations split the Japanese forces and rendered them incapable of cohesive action.

The Japanese forces isolated in the mountains of northern Luzon still controlled the Cagayan valley, and operations were continued to eliminate them. United States infantry and Philippine guerrillas engaged in fierce fighting to force the southern entrances to the valley while

other guerrilla forces reconquered northwest Luzon. These latter, with the assistance of rangers from the United States 6th army, captured the port of Aparri on June 21, 1945. Two days later, elements of the United States 11th airborne division dropped just south of Aparri and in the ensuing 3 days pushed 25 mi. up the valley to link up with the forces which had forced their way northward through the mountain passes. The juncture of these two forces completed the conquest of the Cagayan valley and to all intents terminated the Luzon campaign, although many large pockets of Japanese remained to be mopped up.

The reconquest of the Philippines was accomplished in eight months of bitter fighting. In that time, 317,000 Japanese had been killed and 7,200 captured. United States casualties totalled 60,600 killed, wounded and missing.

7. Iwo Jima.-While the occupation of Saipan, Tinian and Guam in Aug. 1944 had provided bases from which long-range bombers could operate against the home islands of Japan, it was recognized that bombing sorties could operate with greater effectiveness and minimum losses if they were provided with fighter support. On Feb. 19, 1945, the United States 5th marine corps (3rd, 4th and 5th marine divisions) landed on the east coast of Iwo Jima (q.v.), one of the Volcano Islands, 750 mi. south of Tokyo. Japanese resistance on this small island, only 2 mi. wide by 5 mi. long, was exceptionally severe. The advantages of superior forces could not be exploited with so little room to manoeuvre. The landings were preceded by heavy air and sea bombardments, which battered down the initial resistance, but once the marines were ashore the Japanese counterattacks were made with unprecedented ferocity, and the sanguinary campaign lasted until mid-March before organized resistance was overcome. On April 7, 1945, the B-29 raids on Tokyo were being covered by fighter planes based on Iwo Jima. In addition, many battle-damaged B-29s were saved by being able to land on Iwo Jima airfields when they were incapable of flying back to their home bases in the Marianas about 800 mi. farther south.

8. The Ryukyus.-All planning for an assault on the home islands of Japan had developed the necessity for a base from which land-based aeroplanes could provide continuous support for the assaulting troops. The island of Okinawa (q.v.) in the Ryukyu group was ideally situated for this purpose. On March 26, 1945, the attack to secure the Ryukyus was launched by the United States 10th army (3rd marine corps, consisting of the 1st and 3rd marine division; 24th corps, consisting of the 7th, 27th, 77th and 96th infantry divisions), commanded by Lieut. Gen. Simon B. Buckner, when infantry elements landed on the small islands of Kerama Retto, off the west coast of Okinawa. Possession of these small islands provided positions from which land artillery could support the landings on the key island of Okinawa. Under cover of an intense land and naval bombardment, the United States 3rd marine corps and 24th army corps went ashore on Okinawa on April 1, 1945. After pushing across the island, the marine corps moved rapidly northward, quickly overrunning that portion of the island. The army corps which was directed to the south was held up by the main Japanese position. Progress against the elaborate defensive positions was slow, and it took until mid-June to break through the successive Japanese defensive lines. On June 18, General Buckner was killed by Japanese shellfire while he was in a forward observation post. Three days later, organized resistance on Okinawa ceased. U.S. casualties totalled 10,585 killed, 36,715 wounded and 1,302 missing, as compared to 109,600 Japanese killed and 7,870 taken prisoner.

The intense ground fighting on Okinawa was paralleled by the heavy and frequent Japanese air attacks on the Allied shipping supporting the assault. The Japanese operated from the relatively close bases on Kyushu and employed large numbers of suicide or Kamikaze planes. These planes carried only enough gasoline for a oneway trip to the attack area and were loaded to their remaining carrying capacity with explosives. The sole object of the pilot was to dive his plane into an Allied ship. In addition, the Japanese employed a small short-ranged aircraft called the "Baka," which was hung under a medium bomber until within range of its target and then guided into a rocket-assisted diving attack by its suicide pilot. It carried more than a ton of explosives in its nose. In 2 months of intensive air warfare, the Japanese lost 20% of their combat aircraft strength. More than 3,400 Japanese planes were shot down over Kyushu and the Ryukyus, and 800 others were destroyed on the ground. Allied losses totalled more than 1,000 planes. More than 250 Allied vessels had suffered damage from Japanese air attacks, including 34 destroyers and smaller craft which were sunk.

9. Borneo.—Preliminary operations for the recapture of Borneo began on May 1, 1945, when elements of the Australian 9th division landed on the island of Tarakan to establish a fleet and air base to support future operations. The operation was strongly supported by Australian and U.S. fleet units and met only slight opposition.

On June 10, preceded by a heavy naval bombardment, the 9th Australian division, reinforced, made an unopposed landing at Brunei bay on the northwest Borneo coast on June 10, 1945. They immediately secured the naval anchorage and airfields against slight resistance and drove toward Seri and Miri, where important oil fields were located. On July 1, additional Australian forces attacked Balikpapan in southeastern Borneo. By mid-July, Allied forces were in complete control of Balikpapan harbour. From their new Borneo bases, Allied air and naval forces were able to interdict the main Japanese land and sea routes of communication to Indo-China and Malaya. No attempt was made to mop up the remnants of the Japanese forces, which had fled to the interior of the island. Isolated from their supplies and without chance of reinforcement, they were no threat to the Allied beachhead. As in Bougainville, New Guinea and New Britain, they were left to "rot on the vine."

10. Reconquest of Burma.—The Japanese conquest of Burma in 1942 had isolated China except for the 500 mi. of hazardous air route over the towering Himalayas. This made it impossible to supply the critical heavy equipment that China desperately needed. While the Allied strategy makers realized that first priority should be given to the defeat of Germany, they also recognized that it was highly important that material assistance be given China in order to keep it in the war. At the Casablanca conference in Jan. 1943, the Washington Trident conference in May 1943 and the Quadrant conference of Aug. 1943, held in Quebec.

plans were initiated and developed not only to reinforce the air transport route to China but also to open the land route.

At the Quadrant conference, the command set-up to accomplish the herculean tasks which confronted the Allies in Burma was created. Admiral Mountbatten was named commander of the newly organized Southeast Asia command (S.E.A.C.), and General Stilwell was made deputy commander, while still retaining his position as chief of staff to Generalissimo Chiang Kai-shek, who retained command of operations in the China theatre. All British and U.S. combat air elements in India were combined into the eastern air command, with Maj. Gen. George E. Stratmeyer as commander.

The initial Allied ground operations against the Japanese in Burma were a series of long-range raids against the Japanese supply lines feeding their forces in northern Burma. A specially trained force, known as the "Chindits," consisting of Gurkhas, Burmese and an English regiment and commanded by Brigadier Orde C. Wingate, secretly penetrated the Japanese lines and invaded Burma in March 1943. Supplied entirely by air, this force played havoc with Japanese communications and operated for several weeks without being caught by the Japanese in force. This original raiding expedition penetrated to within 120 mi. of the Burma road before being ordered to return (see above, p. 728).

The success of General Wingate's air-supported operations inspired the formation in Aug. 1943 of the first air commando force of the U.S. Army air forces, commanded by Col. Philip G. Cochran. This force of transport, glider, fighter, medium bomber and liaison aircraft was especially designed to support operations such as General Wingate's. Also, in Aug. 1943, the decision was made to form a U.S. long-range penetration unit similar to Wingate's 77th Indian infantry brigade. This unit, offi-

Advances on Okinawa were deceptively rapid after the initial landings of April 1, 1945, as is shown in this picture of U.S. marines covering rough terrain almost on the double. Fierce resistance was not encountered until Naha and Shuri were reached in the drive southward

cially entitled the 5307th composite unit (provisional) but popularly called "Merrill's Marauders," after its commander, Brig. Gen. Frank D. Merrill, was formed by recruiting jungle-trained and tested volunteers from United States forces in the Southwest Pacific, the South Pacific and the Caribbean defense command. By Feb. 1, 1944, five months after the initial decision to organize this force, it had been formed, transported to India, trained and turned over to General Stilwell to assist the advance of his Chinese divisions already pushing down the Hukawng valley.

General Stilwell's plans for the 1944 campaign were keyed entirely to the construction of the "Ledo Road." This effort to construct a new land route to China by connecting Ledo in the upper Brahmaputra valley of India with the old Burma road near Bhamo, in northern Burma, involved the building of nearly 300 mi. of heavy duty highway through virgin jungle and precipitous mountains. The route selected crossed the Patkai Mountains, forming the boundary between India and Burma, through Pangsan pass, then south and east through the Hukawng and Mogaung valleys to Myitkyina in the upper Irrawaddy valley and continuing south to Bhamo, then southeast to the junction with the old Burma road.

Operations begain in Oct. 1943, when two U.S.-trained Chinese divisions moved into the Hukawng valley. By Feb. 1, 1944, these troops had advanced 60 mi. against increasing opposition from approximately 7,000 Japanese troops concentrated in the area. Aided by the wide flanking and deep enveloping movements of the "Marauders," the advance continued at the rate of about one mile per day until Myitkyina was reached on May 19, 1944. Both Myitkyina and Mogaung fell to Allied forces in July 1944,

after a two-months siege, and the besieging forces immediately moved on Bhamo, farther south. Meanwhile, troops along the Burma-Chinese border initiated an offensive in May 1944 and drove westward astride the old Burma road.³ The link-up of these forces on Jan. 27, 1945, assured the success of the Ledo road venture.

General Stilwell's position in the command set-up in the China-Burma-India area placed him squarely in the middle of the political crosscurrents of two great governments, neither of which was his own. His inescapable involvement in complex political and military problems which he was in no position to solve or control inevitably led to conflicts of personalities that rendered a change advisable. On Oct. 28, 1944, General Stilwell was recalled to Washington. At the same time, the U.S. Asiatic administrative area was divided into two theatres, the India-Burma, commanded by Lieut. Gen. Daniel I. Sultan, and the China theatre. The latter was commanded by Maj. Gen. Albert C. Wedemeyer, who succeeded General Stilwell as chief of staff to the generalissimo. (W. A. WR.)

(a) Arakan.—The most important field command, that of the 14th army, was assigned to Lt. Gen. (later Gen. Sir) William Slim.

In Jan. 1944, aggressive British operations opened with the lifting of the monsoon clouds when the British forces began to press down the Arakan coast. They ran headlong into a Japanese advance intended to seize southern Bengal. Two British divisions were encircled. This time, however, they did not yield their ground. They stood fast as ordered, and were supplied entirely by air throughout a three-week siege. At the end of this time the Japanese themselves were trapped. Fresh British troops, descending from the north, pressed them against the anvil of the still intact British positions and hammered them to pieces. Thus ended, disastrously, the first Japanese "March on Delhi."

(b) Imphal to Rangoon.—The second march was not long in coming; indeed, it hinged upon the first. A further purpose of the Japanese in invading south Bengal had been to draw off the British reserves while they delivered their main blow against the central front. This was based upon the Plain of Imphal, a plateau in the Manipur mountains.

In mid-March 1944 the Japanese crossed the Chindwin at several points with 100,000 troops and converged upon Imphal. They also struck farther north at Kohima, a hill station on the mountain road from Assam to Imphal. Within a few days the Japanese had isolated the British army corps centred around Imphal plain; from Kohima they threatened to descend into the Brahmaputra valley and cut off the U.S.-Chinese force which had begun its march over the mountains into the northern valleys, building the Ledo road as it went. The Japanese invasion would also have overrun the chain of airfields in Assam which were the Indian terminal of the Hump air-route. Thus all communication with China would have been severed at a blow, and the republic possibly forced out of the war.

General Slim had anticipated the Japanese plan and had ordered his outlying divisions to withdraw into the plain, which he had prepared as a jungle Stalingrad. He had not foreseen the speed or strength of the Japanese drive upon Kohima, where a garrison of 3,000 assorted troops, many of them already wounded, received the impact of a crack Japanese division of 18,000. The little garrison at Kohima held the gate to India for three weeks, when they were relieved by the advance of Lt. Gen. Sir Montagu Stopford's 33rd Indian corps. Storming the

Kohima heights by Irontal assault, Stopford passed on to break the siege of Imphal after three months of the fiercest fighting seen upon the Burma battlefields.

The severe struggle upon Imphal plain smashed the spine of the Japanese army in Burma. The victorious British. Indian and African regiments of the 4th Indian corps (Lt. Gen. Sir Geoffrey Scoones's command) pressed hard in pursuit of the beaten Japanese, and by the end of August the last organized units had been expelled from India. While this long slogging battle was raging, an airboine invasion of 10,000 men under Wingate had landed in the rear of the Japanese army and caused continuous havoc there. Wingate himself was killed in a flying accident, but his Chindits remained beyond the Chindwin to four months.

The condition of the Japanese was now everywhere desperate. The 14th army had broken their front and the integrated British-U.S. air force had disrupted their rear As the Chinese-U.S. forces under Stilwell forced their way into Myitkyina, the last remaining Japanese stronghold on the upper Irrawaddy and the key to the Burma road, the 14th army fought its way down to the Chindwin river.

By the beginning of 1945 the 14th army was deployed in strength in the plains north of Mandalay and had forced a bridgehead across the Irrawaddy 40 mi. above the city. Farther northward, Stilwell's U.S.-Chinese forces had cut their way through to the Burma road and reopened the land link to China. At this point an urgent new problem arose for the quartermasters; the armies were now 1,000 mi. from their main sea base at Calcutta. The sappers and pioneers had performed miracles of road building, but to supply by overland route a host which now numbered close to 1,000,000 men had become an insuperable difficulty. The air force was called upon to bridge the gap. Men, weapons, ammunition, rations, mules and oxen were borne through the skies above the jungle to keep the armies marching. This air lift rose in the end to a peak of 80,000 tons a month. But since there was an economic limit for air supply, it now became imperative to wrest airfields from the Japanese where the transport aeroplanes could be serviced and refuelled. Admiral Mountbatten therefore ordered a series of amphibious operations, supported by Lt. Gen. Sir Philip Christison's 15th corps, down the Arakan coast to secure these objectives.

By March General Slim had massed the greater part of his 14th army along the western bank of the Irrawaddy, threatening Mandalay. Beyond the river, the Japanese concentrated to meet the expected thrust against the city. But Slim by a secret march of 200 mi. passed a whole corps across their front, and, forcing the passage of the liver south of Mandalay, fell upon the key point of the Japanese rear at Meiktila. This was the decisive battle of the campaign; afterward, the Japanese army disintegrated.

The 14th army stormed southward in two columns upon Rangoon. As it went, the Karen tribesmen of the hills along the China frontier, organized and led by British officers who had parachuted among them, rose and barred the hurried retreat of the remaining intact Japanese forces. Meantime, Rangoon itself had been seized on May 3 by an air and sea assault. The remnants of the Japanese army, now shattered beyond repair, sought to escape across the Sittang river. The last battle of the campaign was fought by the 17th Indian division upon the banks of the river which three years before they had passed in retreat.

Admiral Mountbatten had prepared two further opera-

³In Jan. 1945, Generalissimo Chiang Kai-shek renamed the Burma-Ledo road the Stilwell road in honour of its greatest protagonist.

tions, one across the jungle toward Siam, the second by sea and air against Singapore, when the atom bomb fell upon the first Japanese cities. This ended the war. Within a few days the remaining organized Japanese forces in southeast Asia, which still numbered close to 700,000 men, had laid down their arms in unconditional surrender.

No notable naval engagements marked the course of the Burma campaign, but from 1943 onward the royal navy re-asserted its mastery of the Indian ocean and its approaches. This command of the sea was the prerequisite of military success. (F. O.)

11. Operations in China.-With the exception of a small number of U.S. ground troops who acted as instructors and advisers in training the Chinese army in modern military techniques, British and U.S. support to their Chinese ally consisted exclusively of air activities, including the air transport of supplies and equipment. Allied strategy, as determined soon after the United States became an active participant, called for concentration of resources on the defeat of Germany. Only after the demands of this task had been met could men and supplies be spared for offensive operations against the Japanese. An important feature of this strategy was the necessity of supplying sufficient military support to keep China in the war and thus contain as many Japanese divisions and aeroplanes on the Asiatic mainland as was possible with China's meagrely equipped and poorly trained forces. Air support was not only the most essential but also the most economical assistance that could be furnished China in accomplishing this strategical objective.

In 1941 and early in 1942, the only effective land air force opposing the Japanese on the Asiatic mainland was the American Volunteer group organized by Col. Claire L. Chennault, whose services had been engaged by the Chinese government. The group consisted of volunteers, mainly former United States army air corps personnel employed under contract by the Chinese. Under the tute-lage of Col. Chennault, a master air tactician, this group compiled an enviable combat record, using hit-and-run aerial guerrilla tactics against a vastly numerically superior enemy.

In April 1942 Chennault was recalled to active duty with the U.S. Army air forces and promoted to brigadier general, and on July 4, 1942, the A.V.G. was disbanded and a small number of its personnel absorbed in the 10th air force. The latter had been established in India the preceding March under the command of Maj. Gen. Lewis H. Brereton. The major mission of Chennault's portion of the 10th air force was the protection of the air transport operations, the only remaining means of moving military supplies to China.

Throughout the remainder of 1942 and all of 1943, the tenuous supply situation precluded any major Allied air offensive in China. However, effective air support aided the ground troops materially in stopping the annual Japanese "rice offensives."

In late 1943, work was begun on the airfields needed for the operations of the newly developed B-29 Superforts. Employing more than 700,000 native labourers, 5 fields in India and 4 in China were completed in April 1944. The long-range bombing operations against Japan by the 20th bomber command, U.S. Army air forces, were initiated on June 15, 1944, with a damaging raid on Yawata.

12. Japanese Offensive Operations, 1944.—The Japanese reacted immediately to the threat of China-based bomber operations and launched powerful offensives against the

air bases in China. A secondary objective was to secure an inland supply route to their forces in southeast Asia. A southward advance from Hengyang occupied the major base at Kweilin on Sept. 17, 1944. By Nov. 26 the airfields at Tanchuk, Luichow, Kweiping and Nanning had been evacuated. On Dec. 10, 1944, Japanese forces, moving north from Indo-China, met columns advancing south from Nanning and opened a through corridor from Korea to Malaya.

This operation marked the successful termination of the last Japanese offensive effort in the war. In the spring of 1945, the armies of China assumed the offensive with a strong attack on the southern front. The Chinese advance recaptured Nanning on May 27, 1945, and during the months of June and July wiped out practically all the gains made by the Japanese in 1944. The sudden cessation of hostilities in Aug. 1945 ended this Chinese offensive, which had steadily gathered momentum. Before it ended, Chinese forces had reached the China sea at Fort Bayard, near the base of the Luichow peninsula.

13. Victory in the Pacific.—Early in 1945 the Allied high command began to put in final form their detailed plans for the operations that would bring victory. The collapse of Germany in the spring or early summer was forecast, and the tremendous task of rapidly transferring the huge Allied military potential to the Pacific area was planned and developed in all its complexity.

Changes in the Pacific command structure to meet the new conditions were directed by the joint chiefs of staff. General MacArthur was placed in command of all United States army forces and Admiral Nimitz of all naval forces in the Pacific on April 6, 1945. At the same time they were directed to prepare for the invasion of the Japanese home islands under guidance of the over-all strategic directive furnished them.

On July 10 the joint chiefs of staff revised the air force command structure. The 20th air force headquarters, which had been in Washington furnishing strategic direction to the 20th and 21st bomber commands in the Pacific, moved to Guam and, under the command of Lieut. Gen. Nathan F. Twining, absorbed the 21st bomber command. The personnel of the deactivated 20th bomber command was transferred to the 8th air force, redeployed to Okinawa from Europe under the command of Lieut. Gen. James H. Doolittle. The two air forces were combined into the United States strategic air force, commanded by Gen. Carl Spaatz. Strategic control of this huge bombing fleet was retained by the joint chiefs of staff.

Throughout July 1945, preparatory operations to soften the main Japanese islands for the contemplated landings continued to build up. Air attacks by very heavy bombers from the Marianas; heavy, medium, light bombers and fighters from the newly developed Okinawa airfields and fighters from Iwo Jima filled the Japanese skies. The United States 3rd fleet, which had been joined by a powerful British contingent, pounded at Japan from Hokkaido to Shikoku. Many Japanese coastal towns were bombarded by the Allied warships.

The plans for the invasion of Japan called for initial landings on the southeast and southwest shores of Kyushu of a force of five United States infantry, one cavalry and three marine divisions, while three additional infantry divisions were held in reserve. The operation, known as "Olympic," was scheduled for early Nov. 1945. This operation was to be followed in early March 1946 by the landing of two armies on plains of Honshu Island east of Tokyo. The contemplated strength of the initial landing force was nine infantry, two armoured and three marine

divisions. The follow-up force was to consist of the United States 1st army, transferred from Europe, and composed of ten infantry and one air-borne division. This landing force had the major mission of destroying Japanese military strength on the main home island and occupying the highly important Tokyo-Yokohama area.

Meanwhile, a project formally initiated in 1941 came to fruition. Research and development of the possibility of releasing, instantaneously, huge amounts of energy through the principle of atomic fission had been conducted in great secrecy in isolated and closely guarded installations in the United States. By an agreement reached in 1940, the project was a joint Anglo-U.S. undertaking—the knowledge and resources of the United States, Great Britain and Canada being pooled under the control of a combined policy committee.

The first successful explosion of an experimental atomic bomb (q.v.) was on July 16, 1945, just three weeks prior to its first operational employment. A report of the results of this experiment was rushed to Potsdam, where the chiefs of state of Great Britain, the United States and Russia were meeting in conference to decide future policies. A quick decision was reached to use this new weapon with the aim of shortening the war and saving lives. On July 26 a joint ultimatum to Japan to end the war unconditionally was issued by the United States and Great Britain and was promptly rejected. Meanwhile, instructions were issued to the commanding general of the U.S. army strategic air force to drop the new bomb on an important Japanese industrial installation of his own choosing, on any date subsequent to Aug. 3.

On Aug. 6, a lone B-29 Superfortress flew high over Hiroshima (q.v.), and dropped a single bomb. It was exploded at a predetermined height above the ground, with devastating results. Of the city 4 sq.mi. were utterly destroyed, and more than 80,000 inhabitants were killed.

Soviet Russia, in compliance with commitments made at

Scheduled invasion of Japan which became unnecessary after the use of the atomic bomb in Aug. 1945. Planned in two phases, operation Olympic called for landings on southern Kyushu in the fall of 1945 and Operation Coronet for the invasion of eastern Honshu early in 1946

Potsdam the preceding month, declared war on Japan on Aug. 8. Russian forces in the far east immediately began the invasion of Manchuria from both the east and the west. Additional forces crossed the Korean-Siberian border on Aug. 10.

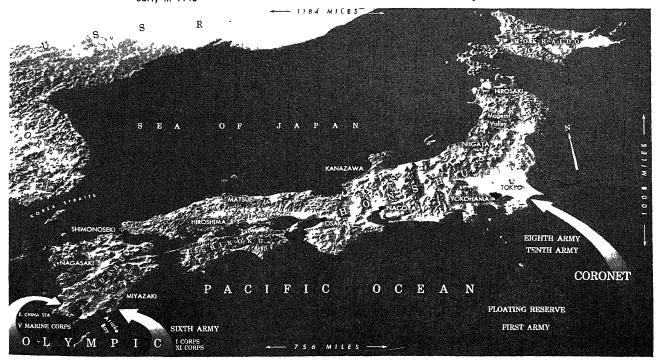

Meanwhile, on Aug. 9, a second atomic bomb struck the city of Nagasaki, an important seaport and industrial centre of Japan. Destruction comparable to that wreaked on Hiroshima resulted, with 3.3 sq.mi. of urban area completely pulverized.

The following day, Aug. 10, the Japanese government sued for peace, accepting, in general, the Allied terms set forth in the Potsdam declaration, with the proviso that the prerogatives of the Japanese emperor as a sovereign ruler would be maintained. After conferring with the other Allied governments, the United States answered the Japanese appeal on Aug. 11, reaffirming the position taken in previous declarations, and stating that the emperor's authority would be subject to the commands of the supreme commander of the Allied Powers (S.C.A.P.).

On Aug. 14, 1945, Japan declared its acceptance of the Allied terms.

Combat activities continued unabated during the interchange of notes. Land-based bombers continued their destructive raids while the Allied fleet inflicted heavy damage with its planes and guns. By agreement, General Mac-Arthur was named supreme commander for the Allies.

Following receipt of the Japanese acceptance, General MacArthur instructed the Japanese surrender envoys to proceed to Manila, where detailed procedure to accomplish the cessation of hostilities was presented to them. These included the formal signing of the general surrender in Tokyo bay, on Aug. 31. However, a typhoon caused a postponement of the ceremony for 48 hours. The ceremony took place at 9:08 A.M., Sept. 2, 1945, on the deck of the U.S. battleship "Missouri," flagship of the United States 3rd fleet. The instrument of surrender was signed on the part of Japan by representatives of the civil and military authorities, while General MacArthur signed for the Allied Powers. Representatives of all nations which

had engaged in the war against Japan affixed their signatures to the document as witnesses.

One hundred and eighteen days after the collapse of Germany, the war in the Pacific was terminated. Japan surrendered while still possessing a capable army of 2,000,000 men and an air force of more than 3,000 planes of all types. Its navy was, however, for practical purposes nonexistent. The nation's military and industrial potential had been completely demoralized by the air and sea power of the Allies. In addition to the destruction Japan suffered in the home islands, the tight and effective blockade imposed during the last six months of the war denied it the raw materials and resources essential to modern war.

(W. A. Wr.)

V. THE WAR AT SEA

A. Prior to U.S. Entry into War

For many decades it had been a keystone of Britain's policy to maintain a fleet equal to any combination of two opponents likely to be brought against it. This policy rested on the belief that Britain could exist only by the importation of a large proportion of its food and could maintain the unity of its world-wide commonwealth of nations only by the mobile power of a dominant navy. The Washington Naval treaty (1922) accepted equality with the United States while limiting the navies of France, Italy and Japan in proportion to their needs. The German navy already, by the Versailles treaty, had been reduced to impotence. The treaty of London (1936) imposed further limitations on cruisers and destroyers; but Italy, under fascist influence and expansionist ideas, declined to be bound, being already engaged in developing a fleet which might in favourable conditions give it mastery of the Mediterranean. The growing nationalism of Germany and the teeling that that country could be made peaceful only by allowing it a navy sufficient to satisfy national self-respect, resulted in the Anglo-German agreement of 1935 and declaration of 1937. These gave Germany the right to build up to 35% of Britain's strength in all categories and to 100% in submarines. Germany had already started to rebuild its fleet and had produced the pocket battleships "Deutschland," "Admiral Graf Spee" and "Admiral Scheer," nominally 10,000-ton cruisers but in fact powerful commerce raiders of considerably larger tonnage. It now settled down in earnest to construct a modern fleet. The "Scharnhorst" and "Gneisenau," 26,000-ton battle cruisers, were completed in 1938, the "Tirpitz" and "Bismarck," capital ships more powerful than any afloat or contemplated elsewhere, were laid down. Submarines were built in great numbers.

Britain became conscious of the inevitability of war as early as 1936 when a rearmament program was begun, but the recovery of the navy was slow. As forecast in 1938 the naval strength of the countries likely to be involved in the coming struggle would in 1940 be as follows:

	Battle- ships	Aircraft carriers	8-in. cruisers	Light cruisers	Des- troyers	Sub- marines
British empire	17	7-11	15	63	188	69
Germany	7	2	5	10	22	119-129
France	10	1	7	12	66	94
Italy	6		7	28	99	120-130

The British battleships were old, and the new program of battleship construction, introduced by Lord Chatfield when first sea lord, could not reach completion till 1941-42.

1. Two Great Strategic Aims.—British strategy had a threefold object: to ensure the safe arrival of supplies of all kinds to the home country, to prevent the landing of

any enemy military expedition on its coasts and to provide force whereby a British expedition could be landed and maintained on enemy territory. Long experience had taught Britain that these essentials were best met by seeking out and destroying any enemy force which showed itself at sea.

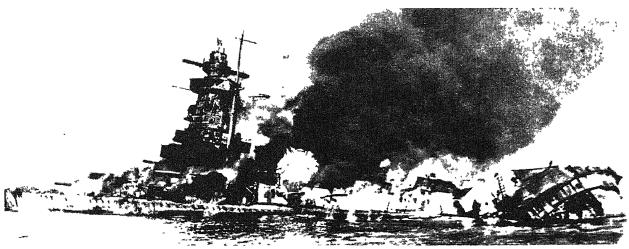

German strategy aimed at cutting off Britain's supplies, primarily by submarines, secondly by surface raiders and thirdly by aircraft. Britain could thus be reduced to impotence, after which an actual invasion, well supported by air, could destroy its power forever. This plan involved disregard of the limitations on the use of submarines agreed on at Washington and demanded not only a large fleet of U-boats but an invincible army and overwhelming air power, all of which Germany had attained by 1939 when it invited war with Britain and France by its invasion of Poland.

The events which followed all took their place in the struggle between these two great strategic aims. Either one might be successful; both could not.

Britain declared war on Germany on Sept. 3, 1939; but before that date Germany had already stationed its fleet for the attack on British merchantmen. The "Admiral Graf Spee" was at sea in the South Atlantic with a number of improvised commerce raiders. U-boats were on the trade routes, and supply ships were in position. Britain had a battle fleet based on Scapa Flow to contain the German fleet, another at Malta to contain the Italian fleet, which, in view of the axis treaties, could not be ignored. A number of cruiser squadrons were formed for trade protection and the hunting of raiders. Britain's greatest weakness lay in the absence of escort craft for merchant-ship convoys. Nevertheless, it was British policy to establish convoys as soon as possible for all except fast merchant ships.

On the opening day of the war the "Athenia," a British passenger liner outward bound carrying 1,480 passengers and crew, was torpedoed off Ireland; and in the first fortnight Britain lost 27 merchant ships totalling 131,000 tons. By Sept. 7, however, the first outward-bound convoy had been assembled and sailed, and by the end of the first fortnight the convoy system was in regular operation and being extended daily. Convoys were escorted by destroyers and trawlers from British waters to longtitude 20°-30° W., and thereafter by cruisers, battleships or armed merchant cruisers as defense against raiders. Many U-boats were attacked, a few were sunk, but as the war developed it became evident that the U-boats could and would operate right across the North Atlantic and that antisubmarine escort must accompany convoys for the whole journey. To meet this threat, the range of action of a number of destroyers was increased by the sacrifice of a boiler to permit added oil stowage, and a simple type of escort vessel known as the corvette was designed and laid down in large numbers in British building yards. A separate organization, coastal convoy, was created for the protection of coastal traffic resulting from the assemblage and dispersal of the great ocean convoys which took place off the west coast of Scotland.

On Sept. 6 Britain suspended its obligations under the London Naval treaty. On Sept. 17 the great aircraft carrier "Courageous" was torpedoed by a U-boat and sunk in the North Atlantic. On Oct. 14 a German U-boat under the command of Kapitan-Leutnant Guenther Prien made a daring entry into Scapa Flow through a narrow channel between two islands and there found and torpedoed the battleship "Royal Oak." This proof that Scapa Flow was not impregnable came as a shock to the British. Urgent measures were then taken to strengthen the base.

The "Admiral Graf Spee," German pocket battleship which was blown up by her own commander near the Montevideo harbour on Dec. 17, 1939, four days after the ship was disabled in a running fight with three British cruisers

Germany meanwhile had developed new types of mines, and on Nov. 19 came the first announcement of sinkings by magnetic mines. Fifteen ships, largely neutrals, were lost in four days by the indiscriminate use of this secret weapon, laid sometimes by aircraft and sometimes by ships. The British secured a mine, discovered its secret and in a very short time developed an antidote and equipped their rapidly swelling fleet of mine sweepers with the means to explode it and so clear a safe channel.

The surface raiders too were active; a German battle cruiser sank the A.M.C. (armed merchant cruiser) "Rawalpindi" off Ireland on Nov. 26, and about the same time the "Admiral Graf Spee" sank the Polish liner "Pilsudski," the British "Doric Star" and a number of other ships. But despite these setbacks Winston Churchill was able to report on Dec. 6 that the convoy system was in full operation and only 1 ship per 750 sailings had been sunk. In addition, the British expeditionary force had been safely conveyed to France.

2. Battle of the River Plate; the Altmark.-On Dec. 13, 1939, a British cruiser squadron under Comm. Henry H. Harwood, consisting of "Ajax," "Exeter" and "Achilles," fought the pocket battleship "Admiral Graf Spee" in the South Atlantic. The "Ajax" and "Achilles" had 6-in. armament, the "Exeter" 8-in., while the "Graf Spee's" armament of six 11-in. and eight 5.9-in. exceeded in broadside weight that of all 3 British cruisers. The action opened soon after dawn; the British divided their force, the "Exeter" taking one side and the two six-in. cruisers the other so as to force the "Graf" to split its fire. The "Exeter" received the brunt of the fire and was heavily hit and eventually forced out of action while the three British, together, so pummelled the German that it turned away and made for the neutral port of Montevideo with the British in pursuit. On Dec. 17 the "Admiral Graf Spee" lest harbour and to the surprise of the British, waiting outside, scuttled itself in mid-channel. Its crew was interned and its commander, Capt. Hans Langsdorff, committed suicide. The action was remarkable for the tactical handling of the cruisers which enabled them to defeat the much more heavily armed "Graf Spee."

The problem of transporting large contingents of troops from overseas was now urgent and was met throughout the war by the use of large fast liners specially fitted up for troop transport. The first Canadian consignment arrived in Britain on Dec. 17, 1939, and the method proved extremely successful, the liners' speed rendering U-boat attacks very difficult.

In Jan. 1940 the British requisitioned all British shipping capable of overseas trade, and in February the Germans announced that all British ships would be sunk without warning.

On Feb. 16 an incident occurred which, though relatively unimportant, created considerable stir. The armed merchantman "Altmark," returning to Germany after its campaign in the South Atlantic with 300 British prisoners of war, was known to be working its way down the Norwegian coast to Germany, inside territorial waters. It put into Josing fjord, and thereupon the British destroyer "Cossack," Commander Philip Vian, entered the fjord, ranged alongside and rescued the prisoners.

3. Operations off Norway and Denmark.-On April 9 Germany invaded Norway and Denmark. It claimed that it was forced to this action because the British had laid mines in Norwegian waters. In fact, however, the mines were laid only on the morning of April 8, when some of the German invading force had already left for Norway. The Germans occupied Oslo, Trondhjem and Narvik as well as a number of other ports. On April 9 the battle cruiser "Scharnhorst" was engaged and severely damaged in an action with H.M.S. "Renown" but escaped under the cover of smoke screens laid by the cruiser "Hipper." On April 10 a British destroyer force led by Capt. H. Warburton-Lee in the "Hardy" entered Narvik fjord to attack German naval forces. In the ensuing battle, one German destroyer was sunk, three were set on fire and a number of supply ships sunk or burnt. The British lost the "Hardy" and "Hunter" and Captain Warburton-Lee was killed. On the same day German troopships were sunk by submarines in the Skagerrak and the cruiser "Koenigsberg" was sunk by the fleet air arm at Bergen.

On April 13 the battleship "Warspite" and a strong force of destroyers made a second attack on Narvik under Vice-Adm. William Whitworth and succeeded in sinking seven German destroyers and capturing the fjord. On the same day the cruiser "Bluecher" was sunk in Oslo fjord. The "Karlsruhe" was sunk by the British submarine "Truant" while the British lost the aircraft carrier "Glorious," by U-boat, and the cruisers "Curlew" and "Effingham." Two days later a British, French and Polish force was landed in Norway, and the British occupied the Faroe

Islands. The German invasion had been successful, though at a heavy cost, including 26 transports. It remained to establish their position, and in the ensuing struggle on land, assisted by greatly superior air support, they forced the Allies to evacuate between June 1 and 4.

The Norwegian adventure gave Germany a long Atlantic coast line and many harbours. It greatly facilitated the submarine campaign and improved the flow to Germany of the important Swedish iron ore. These advantages were bought at the cost of a serious dispersion of force in all three arms, as well as the moral stigma of having invaded two peaceful countries without the slightest justification, an action which shocked the neutral world.

4. Germany on the Atlantic.—By May 13, 1940, the Netherlands, overrun by German troops, capitulated; four days later Brussels was taken and German forces had broken through in France. The royal navy was doing all in its power to evacuate Dutch and Belgian merchantmen to British ports and succeeded in saving very considerable tonnage. On May 28 Belgium surrendered. The British army, split off by the German advance from its French allies, was compelled to retreat to the coast. Dunkirk was chosen as the place of evacuation. The British mobilized every available small vessel to assist their destroyers in this evacuation. The operation started on June 1 and lasted 4 days, during which 345.585 men were brought back, mostly from open beaches; but their equipment was lost.

On June 10 Italy declared war on Britain and France; four days later Paris surrendered and on June 15 the British completed their army's evacuation from Brest and St. Nazaire. On June 24 an armistice was concluded between Germany and France. Britain then stood alone, its army without equipment, and only its navy and its air force (greatly reduced by losses in France) between it and invasion. The occupation of the Netherlands, Belgium and France, as well as Denmark and Norway, now gave Germany a vast Atlantic coast line. Its U-boats need no longer run the gauntlet of the Dover straits or the Fair Island channel, and it promptly developed U-boat bases at Brest, St. Nazaire, Lorient and Bordeaux. Its aircraft based near the coast in the Netherlands, Belgium and France could operate over the North sea, English channel and Bay of Biscay, while its fast coastal craft, based on Dutch and Belgian ports, were well placed to attack British coastal convoys moving in and out of the port of London. The British prepared to meet invasion. They kept a close watch on channel ports where invasion barges were collecting and harried them by bombing.

5. Immobilization of French Navy.—Now that Italy was in the war the French navy presented a serious problem; for if Germany obtained possession of it, the combined Italian and German-French navies would be superior in every arm to the royal navy. The French armistice provided that the French fleet was to be assembled in French and Italian ports and demilitarized except for units which the Italian or German governments desired for the protection of French colonial interests. This obvious loophole and the distrust in German promises prompted the British to take decisive action. On July 3 all French warships in British ports were boarded and placed under British control. Ships in North African ports were offered alternative conditions designed solely to keep them out of German hands. An important contingent, including the battle cruiser "Dunkerque," lay at Oran; Adm. Marcel-Bruno Gensoul, in command, refused to accept any conditions and prepared his ships for sea and for action. A British force under Adm. Sir James Somerville, after eight-and-a-half hours' delay, opened fire; a battle ensued in which the majority of the French force was destroyed. The battle-ship "Richelieu" lay at Dakar, and there again the French admiral refused the alternatives offered. On July 8 a launch manned by British personnel entered Dakar, placed depth charges against the "Richelieu's" hull and seriously damaged it. Naval aircraft completed the damage which kept the ship immobilized for two-and-a-half years.

On July 9 a British fleet was at sea to the east of Malta covering an important convoy, when a mixed Italian force of two battleships, cruisers and destroyers was encountered. The British force gave chase, but the Italians turned away, covering their retreat with smoke screens. One Italian battleship was hit and a cruiser torpedoed by aircraft. The British pursued to within sight of land and although heavily attacked by aircraft suffered no loss. Ten days later the cruiser "Sydney," Capt. J. A. Collins, accompanied by destroyers, encountered two Italian cruisers and sank the "Bartolomeo Colleoni."

6. Operations during Battle of Britain.—In Aug. 1940, the threatened invasion of Britain appeared imminent. The Germans had reorganized their armies for the task, and embarkation was being practised. On Aug. 8 the campaign opened with mass air raids, and the battle of Britain began. In this, British fighter aircraft created havoc in the German bombing forces, which were eventually so weakened that the German high command was forced to abandon its plans for invasion, a fact which became apparent to the British as the autumn wore on. In November Germany concentrated its air attacks on British ports. Southampton was the first to suffer. Portsmouth, Plymouth, Portland and Bristol all experienced severe raids and were gravely damaged. The London docks were frequently attacked and immense fires caused. None of these ports, however, was entirely immobilized; and work continued.

The battle of the Atlantic also continued. In June 1940 the liner "Lancastria," carrying troops, was bombed and sunk, as was the A.M.C. "Andania." In July the "Arandora Star" was sunk, in August the A.M.C. "Transylvania," and in September the "City of Benares" carrying evacuee children, all by U-boat. In October the "Empress of Britain" was sunk by bombing. Against these successes the British could claim the capture of the German liner "Weser" in the Pacific.

The British were desperately short of escort vessels, and on Sept. 3 an agreement with the U.S.A. was announced leasing a number of bases to the latter in exchange for 50 overage U.S. destroyers, transferred to the royal navy. These vessels, after a good deal of modernization, helped greatly to fill the void.

7. Mediterranean Operations.—In the Mediterranean the British continued to command the sea, operating by extensive sweeps in search of the Italian fleet. On Oct. 12 the cruiser "Ajax," Capt. E. D. B. McCarthy, encountered three large Italian destroyers south of Sicily and sank two of them. In a subsequent action against a cruiser and four destroyers it crippled one, the remainder escaping in darkness. Next day the cruiser "York" found the crippled destroyer and sank it after allowing time for its crew to abandon ship. British submarines maintained continuous pressure against Italian supply ships plying to the African coast and sank three in October.

These results did not satisfy the British naval commander in chief, Sir Andrew Cunningham. The Italian battle fleet of two new and four reconstructed battleships constituted an ever-present threat to his supremacy. A carefully prepared attack by carrier-borne torpedo aircraft was

delivered against the great Italian base at Taranto on the night of Nov. 11. At least three battleships lay in the outer harbour; all were hit and left in a sinking condition. Only the shallowness of the water prevented their final loss. In the inner harbour two cruisers were badly damaged and two fleet auxiliaries sunk. The British lost only two aircraft. This shattering blow established British naval supremacy in the Mediterranean, but shore-based aircraft operating from Sicily, Sardinia, the African coast and the Dodecanese still interfered with free movement of British transports. The majority of these, including troop transports and ammunition ships, now made the long journey round the cape in order to maintain and reinforce the British armies operating against Ethiopia, Eritrea and Libya.

In the North Atlantic the struggle continued to be severe. On Nov. 5 the A.M.C. "Jervis Bay," Capt. E. S. F. Fegen, was escorting a convoy of 38 ships when the pocket battleship "Admiral Scheer" was sighted closing to attack. Captain Fegen at once ordered his convoy to scatter and make smoke, while he steamed rapidly toward the raider and opened fire. It was evident from the first that the odds were hopeless; nevertheless, he engaged the "Scheer" for nearly an hour and held the Germans' fire. When at last the "Jervis Bay," crippled and in flames, sank beneath the waves, the merchantmen had had time to scatter so that of the whole 38 only 4 were sunk.

In the Mediterranean the British now scored a series of successes. The offensive launched from Egypt on Dec. 9, 1940, led to a rapid advance culminating in the capture of Benghazi. This advance was strongly supported by the royal navy whose main base was now, by agreement with the Egyptians, at Alexandria. But at this point, because of the pressure on Greece from German and Italian forces, the British decided to send reinforcements there. There followed a number of contacts between naval forces in which the Italians invariably retired behind smoke screens. Powerful forces of Italian and German aircraft, however, attacked with determination; and on Jan. 14, 1941, while protecting a convoy en route for Greece, the aircraft carrier "Illustrious" was damaged and the cruiser "Southampton" set on fire so heavily that the British sank it. On Feb. 9 Vice-Admiral Somerville led a heavy bombardment on the naval base at Genoa which caused great destruction. In the Red sea Kismayu was captured on March 6, and ten axis ships were sunk or captured.

8. Battle of Cape Matapan.—On March 19, 1941, aircraft reported Italian cruisers southeast of Sicily steaming to the southeastward. The British commander in chief despatched a force of four cruisers, a carrier and some destroyers under Vice-Adm. H. P. Pridham Whipple to make contact and followed with three battleships screened by destroyers. The light forces sighted an Italian battleship and two cruisers, and while attacking the battleship by torpedo aircraft, led the cruisers toward the British battle fleet. The Italian battleship received several hits in the course of the day's fighting but escaped, badly damaged, to its base.

A second Italian force of two battleships and several cruisers was now sighted some distance to the northward, and a chase ensued until the 8-in. cruiser "Pola," which had been attacked by torpedo aircraft, was sighted, stopped and heavily damaged, and the British battle fleet closed on it. Night had already fallen when three more large cruisers crossed the British battle fleet's bows, possibly in support of the "Pola." The battleships opened fire and the cruisers were quickly destroyed. The result of this action was that the three 8-in. cruisers "Pola," "Zara" and

"Fiume," one or two smaller cruisers and two destroyers were sunk. The remaining Italian forces escaped northwestward. The British lost 2 aircraft but had no other casualties; they picked up more than 900 Italian officers and men next morning. The action was notable in having been brought on by the delay imposed on the Italians by torpedo aircraft. The Italians had 3 battleships, 11 cruisers and 14 destroyers at sea against the British 3 battleships, 1 aircraft carrier, 4 cruisers and a number of destroyers. Greek destroyers co-operated effectively with the British.

On April 1, 1941, Asmara, the capital of Eritrea, surrendered; and an Italian flotilla in the Red sea was engaged and sunk.

The necessity for reinforcing Greece seriously weakened the British forces in Africa. The Germans were coming to the rescue of their Italian allies and pouring panzer troops and ammunition into Tripoli. This supply line had Malta on its flank, and although the island had suffered severe bombing and was no longer used by the battle fleet, it remained the base of destroyers and submarines. These harried the Italian convoys. On the night of April 15-16 a force of four British destroyers led by the "Jervis" sighted a convoy of five large ships escorted by four destroyers. In the first few minutes of the British attack the leading Italian destroyer was overwhelmed and sunk, then every ship of the convoy was set on fire and a battle ensued between the remaining destroyers. The British lost the "Nubian" by torpedo. All the Italian destroyers were sunk or set on fire, while the entire convoy which consisted of ammunition ships, motor transport and German troops was de-

But despite naval victories the British position in the Mediterranean now suffered a decline. On April 3, 1941, the British evacuated Benghazi; and a retreat to the Egyptian frontier followed. Tobruk held out and was supplied from the sea.

9. Operations off Greece and Yugoslavia.—On April 6, 1941, the Germans invaded Greece and Yugoslavia, the Yugoslav army withdrawing. Salonika fell to the Germans on April 9, and Monastir was reached the next day. The British forces in Greece now fell back fighting, and on April 23 the Greek government was evacuated to Crete. Two days later the Germans occupied Lemnos Island and shortly afterward the whole of the Dodecanese group. The British were forced to evacuate their army in Greece, and about 43,000 escaped to Egypt and to Crete, 3,000 being left. The Germans then brought overwhelming air superiority to bear on Crete and made parachute and glider landings. Their sea-borne troops suffered heavy losses, but they gained a foothold and the British found it necessary to evacuate Crete also. This proved a most costly operation. In the course of May and June the British lost by aerial attack three cruisers and eight destroyers, proving beyond all doubt that naval operations within the reach of shore-based aircraft could not be carried out without air support. By June 1, however, the evacuation of Crete was complete.

In the summer months of 1941 the air attacks on Malta were intense, but the fortress held out and the British fought their convoys through and took a heavy toll of Italian supply ships to Africa. In the course of these operations the battleship "Nelson" was torpedoed on Sept. 27, but not fatally. The aircraft carrier "Ark Royal" was torpedoed and sunk on Nov. 14. The "Barham" was torpedoed and sunk on Nov. 25.

On the reverse side, Capt. W. C. Agnew in the cruiser

"Aurora," patrolling on the night of Nov. 9 in the central Mediterranean with a force of two cruisers and two destroyers, encountered two convoys of ten supply ships escorted by destroyers and covered by two 8-in. cruisers. In the resulting action all the supply ships were destroyed and three destroyers sunk, a fourth being subsequently sunk by a British submarine. The British suffered no casualties. An armed merchant cruiser and several supply ships were sunk two days later. British submarines had many successes.

Supported by the fleet, the British attacked in Libya on Nov. 18 and gained much ground. Severe fighting followed but by Dec. 1 the German and Italian tank forces had pressed the British back once more to the Egyptian frontiers and beyond, and Tobruk was again invested.

Turning to the Atlantic, the British had planned a raid on the Lofoten Islands where, under German occupation, quantities of fish oil and other products were made and sent to Germany. On March 4 the raiding squadron fell upon the islands, captured the garrison, sank ten merchant ships and some armed trawlers, revictualled the Norwegian inhabitants, destroyed the fish-oil plant and withdrew with their prisoners. The operation was sudden, swift and precise. There were a few German but no British casualties.

10. The "Hood" and "Bismarck."—In the middle of May 1941 the battleship "Bismarck," which for some time had been sheltering at Bergen, set out on a commerce-raiding expedition, and the task of finding and bringing it to

action fell to the commander in chief of the home fleet, Adm. Sir John Tovey. He sent the cruisers "Norfolk" and "Suffolk" to the Denmark straits, while three groups containing capital ships took up intercepting positions. On the evening of May 24 Adm. W. F. Wake-Walker in the "Norfolk" sighted the "Bismarck" and a cruiser and started to shadow, and as a result the battlecruiser "Hood" and the new battleship "Prince of Wales" made contact and engaged next morning. The engagement was fortunate for the Germans, for while both the "Bismarck" and "Prince of Wales" received only slight damage the "Hood" was hit in a magazine and blew up. The "Bismarck" turned southwestward and broke off action; but it was shadowed, and the "Prince of Wales" again engaged toward evening. The Germans turned to the west and then to the south in an endeavour to shake off pursuit. But during the night the "Victorious" launched a torpedo aircraft attack which scored a hit. At 3 A.M. on May 25 in misty weather, contact was lost, the "Bismarck" being then about 350 mi. S.S.E. of the southern point of Greenland. Admiral Tovey's squadron, led by the "King George V," was closing in from the north, while another group under Admiral Somerville was converging from the south. It was not until 10:30 A.M. on May 26 that the quarry was again located by aircraft. The "Bismarck" was now alone and steering east, about 550 mi. W. of Land's End. In the course of the day the 'Ark Royal" sent off two striking forces, the second of

The "Ark Royal," British aircraft carrier torpedoed by an axis submarine off Gibraltar, shown listing before it sank in the Medi-

which succeeded in making two torpedo hits. Cruisers were then in touch, and during the night successful tolpedo attacks were led by Captain Vian in the "Cossack," after which the "Bismarck" was reduced to eight knots though its gun armament was still intact. At 9 A.M. on May 27, the "King Geoige V" and "Rodney" engaged and silenced it; finally the "Dorsetshire" sank it with torpedoes. About 100 officers and men were rescued. This lesson made the German grand commander in chief, Adm. Erich Raeder, very chary of sending out commerce-raiders.

11. Naval Help for Russia.—On June 22, 1941, the war entered a new phase when Germany invaded Russia. Russia was desperately short of munitions and means had to be found to help it. Stretched to the limits though it alleady was, Britain organized a system of convoys to Archangel, the first convoy sailing in August. These convoys continued throughout the war. The Germans based on Norway were well placed to interfere by aircraft, surface ships and submarines. Each successive convoy was attacked, but the great majority of ships got through.

On Aug. 15 President Roosevelt met Prime Minister Churchill in Argentia bay, Newfoundland, and drew up the Atlantic charter. That these two leaders, so vital to their countries' welfare, could risk an Atlantic voyage was a measure of the mastery of the submarine menace which had been attained. But while fast and well-escorted ships could travel with relative safety, the slower convoys, still inadequately protected, were far from safe. In the first 11 months of the war, Britain lost 1,500,000 tons of shipping, out of a total of 21,000,000. Losses averaging 500,000 tons a month were sustained in the early part of 1941, when Germany had developed its Atlantic bases and its production of U-boats had become gigantic. Adm. Karl Doenitz, directing the U-boat war, constantly introduced new tactics, while, step by step, the British countered them. April 1940 had seen the first corvette at sea; by 1941 they were afloat in large numbers, and many U-boats had been sunk. In the latter months of that year losses diminished markedly to 180,000 tons per month and it seemed that, for the time being at least, the British had the upper hand in the unending struggle.

Mine sweeping had developed to vast dimensions, the sweepers now being equipped to destroy magnetic and acoustic mines as well as the older contact mines.

In British waters hundreds of motor gunboats had been built and were at sea guarding the coastal convoys and fighting the E-boats which operated from Dutch and Belgian harbours. The struggle to protect shipping was at a peak. The percentage of losses on a voyage was never great, but cumulatively they were serious.

British eyes were turning to the east, where Japan was becoming increasingly menacing. On Aug. 24, 1941, Churchill warned Japan that opposition to the passage of supplies to Russia must stop. Such reinforcements as could be spared were sent to Hong Kong and Singapore.

(C. V. U.)

B. War at Sea after Pearl Harbor

In Dec. 1941 the United States was confronted with war at sea in both the Atlantic and Pacific oceans. The geographical position of the nation necessarily required control of the seas before U.S. troops could fight offensively upon land.

In the Atlantic, United States strategy involved maintaining lines of communication to Great Britain and to luture bases of operations against the continent of Europe, in opposition to the vigorous efforts of the German submarine and air forces to secure and maintain control of

that ocean. In the Pacific, not only the initial success of the Japanese attack upon Hawaii but the lack of any well-developed bases in Australia and in the South Pacific islands, combined with the immense distances, placed Allied naval forces immediately upon the defensive. However, before the end of 1942 the offensive had been seized in both oceans.

1. Defensive Phase in the Pacific.—After the Pearl Harbor attack, which resulted in the permanent loss of two battleships of the United States Pacific fleet and the incapacitation of six others for varying periods of time, the Japanese withdrew from the central Pacific and, except for the capture of Guam and Wake Island, devoted their attentions to the Philippine Islands, the Malay region and the Netherlands Indies. The Allied naval forces in that part of the world were hopelessly outnumbered, but though incapable of permanently checking the Japanese advance, they undertook with great gallantry to delay it as long as possible. The British battleship "Prince of Wales" and battle cruiser "Repulse"-sent to Singapore as a token force, without adequate escorts or air support—were sunk on Dec. 10, 1941, by Japanese torpedo-carrying planes before they had an opportunity to give any account of themselves. With no hope of predictable reinforcement from the United States Pacific fleet, the small U.S. Asiatic fleet (commanded by Adm. Thomas C. Hart, consisting of 3 cruisers, 13 overage destroyers, 29 submarines, 2 squadions of patrol planes and a few gunboats and auxiliaries, operating in conjunction with equally slender British and Dutch forces) was all that was available to stem the Japanese tide. At the outbreak of war Admiral Hart's forces in the Philippines were already skilfully deployed in anticipation of a possible attack, which soon came. On Dec. 10 the navy yard at Cavite was practically wiped out by Japanese bombing, and the Asiatic fleet (save for units which remained to assist in support of the army's positions on Bataan and Corregidor) moved south to the Netherlands Indies. On Jan. 3, 1942, Gen. Sir Archibald P. Wavell of the British army assumed supreme command of the Australian, British, Dutch and U.S. forces in the theatre, and Admiral Hart became commander of the Allied naval forces.

During the next few months, the Japanese advanced rapidly in many directions by overcoming the inferior Allied air opposition at a given point of attack and then sending heavily screened amphibious forces to make landings. As soon as they were in control of a new area, they would repair the airfields and move on to still another. With totally inadequate air support, the Allied naval forces could only attempt to delay the Japanese advance by breaking up landing operations wherever possible. In the battle of Macassar strait, early in the morning of Jan. 24, 1942, and in Madura strait on Feb. 4, naval attempts were made to disrupt Japanese invasion forces. Though one drive might be impeded by one of these gallant delaying actions, others would go forward almost simultaneously, and by mid-February the Japanese were in a position to advance on Java. At this point, in accordance with previously made international agreements, the command of the Allied defensive was assumed by Netherlands officers, and Admiral Hart relinquished operational command of the Allied naval forces to Vice-Adm. C. E. L. Helfrich of the royal Netherlands navy. Attempts to halt the Japanese invasion of Java were made in Bandung strait on the night of Feb. 19-20 and in the battle of the Java sea on Feb. 27. Allied losses were heavy, and on Feb. 28 the

Japanese landed on the north coast of Java. As no suitable base for naval surface forces remained, the Allied naval command was dissolved, and the surviving U.S. naval vessels proceeded to Australia.

In the course of March 1942 Java was occupied, and the Japanese continued their plan of conquest in directions as widely separated as Burma and New Guinea. A British fleet including old battleships and aircraft carriers under command of Adm. Sir James Somerville had been assembled in the Indian ocean to prevent the westward spread of the Japanese offensive. This force suffered the loss of the cruisers "Dorsetshire" and "Cornwall" in the Japanese attack on Colombo, Ceylon, on March 28, and of the aircraft carrier "Hermes" and other smaller vessels in a Japanese raid on Trincomalee, Ceylon, on April 9. The possibility that the Japanese would follow up this successful offensive in the Indian ocean by threats farther west emphasized the strategic importance of Madagascar, which was in Vichy-French possession. Consequently, to forestall any Japanese aspirations in that direction, a British force, under command of Rear Adm. E. Syfret, successfully occupied the main base at Diego Suarez at the northern end of Madagascar on May 5-7. However, the April raid on Trincomalee proved to be the last blow struck by the Japanese in the Indian ocean; and it was to the eastward in the Pacific, where the United States navy was gathering its strength, that the war at sea was to be decided.

No United States aircraft carriers had been at Pearl Harbor during the Dec. 7 attack, and so Adm. Chester W. Nimitz, who had become commander in chief, United States Pacific fleet, late in Dec. 1941, was able to use these ships in the first offensive strikes of the Pacific war, while the situation was still going from bad to worse in the far east. A force consisting of the carriers "Enterprise" and "Yorktown," cruisers and destroyers, under the command of Vice-Adm. William F. Halsey, Jr., struck various points in the Marshall and Gilbert Islands beginning Feb. 1, 1942, with such success that several similar raids were conducted during the following weeks on Wake Island, Marcus Island and the New Guinea ports of Salamaua and Lae, where Japanese troops were landing in early March. On April 18 United States army bombers, which took off from the carrier "Hornet," struck Tokyo.

By the middle of April 1942 the Japanese had extended their conquests into New Guinea, New Britain and the Solomon Islands and had attained a position from which they could threaten the whole of Melanesia as well as the continent of Australia; they were moving their forces in anticipation of an offensive to the southeast that would threaten the lines of sea communication between the west coast of the United States and Australia and New Zealand. To protect these lines of communication, advance bases were being developed in the Fijis and New Caledonia to serve as fuel and troop staging stations, and consequently any Japanese movements in that direction were anxiously watched.

2. Battle of the Coral Sea.—Thus, when the Japanese began to occupy Florida Island in the Solomons on May 3, 1942, Rear Adm. Frank Jack Fletcher, who was cruising in the Coral sea with a force consisting of the carrier "Yorktown," cruisers and destroyers, undertook to hinder them. Planes from "Yorktown" on May 4 sank and damaged various Japanese vessels at Tulagi, and on the following day Fletcher's force joined other United States and Australian units, including the carrier "Lexington." The concentration of Japanese forces in the Bismarck archi-

pelago—New Guinea area indicated that an amphibious operation, possibly against Port Moresby, New Guinea, was in prospect. Consequently, Rear Admiral Fletcher placed part of his force within striking distance of the probable course of the invasion fleet and moved his remaining snips northward in search of the Japanese covering forces. On the morning of May 7 aircraft from the "Lexington" and "Yorktown" located and sank the Japanese carrier "Shoho." The carrier "Shokaku" was attacked and damaged to such an extent that it could not be used, as planned, in the forthcoming operation against Midway. In a counterattack by Japanese carrier planes, both the "Lexington" and "Yorktown" were damaged, and it later became necessary to abandon the "Lexington" and have it sunk by one of the United States destroyers.

The battle of the Coral sea, from which the Japanese forces withdrew with heavy losses, was the first major check that Japan had received in an otherwise successful campaign of aggression. It was, moreover, the first major naval engagement in history between aircraft of opposing fleets, with no contact between the surface vessels of the fleets. Thus ended the period in which the United States navy was entirely upon the defensive in the Pacific, save for the operations of its submarines, which from the very beginning brought the war to regions that the Japanese thought they controlled. Although entirely unpublicized, for reasons of operational security, the activities of these submarines reduced the Japanese supply of fuel from the East Indies and decimated their shipping. Postwar interrogations of Admirals Osami Nagano and Soemu Toyoda, successively chiefs of the Japanese naval general staff, indicated that during the first half of the war U.S. submarines caused the greatest difficulty, just as naval aviation did in later years. (See Submarine Warfare.)

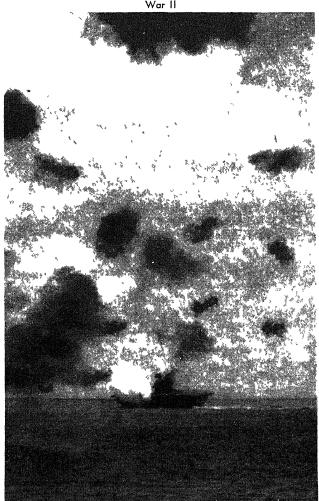

3. Battle of Midway.—During the lull which followed the battle of the Coral sea, it was correctly assumed that the Japanese were preparing for a large-scale operation somewhere, and the best evidence seemed to indicate that they would strike in the central or northern Pacific or both. In consequence the carriers and supporting vessels that had been operating in the South Pacific were recalled, and the ships available—carriers "Enterprise," "Hornet" and "Yorktown," 8 cruisers, 14 destroyers and about 20 submarines—were organized into task forces commanded by Rear Adm. Raymond A. Spruance and Rear Admiral Fletcher. A marine corps air group based on Midway Island and army bombers from Hawaii were made ready for active operations.

Scouting and patrol lines, which had been established to the westward of Midway, sighted a large Japanese attack force on the morning of June 3 which was bombed later in the day by a squadron of army B-17's. On the following day Japanese aircraft bombed Midway, while army, navy and marine corps planes from Midway attacked the Japanese fleet. Planes from the "Hornet," "Enterprise" and "Yorktown" attacked a force of four Japanese carriers with telling results, though planes from a Japanese carrier inflicted damage on the "Yorktown." Throughout June 5 and 6, army and navy aircraft, which had now won control of the air, pursued and attacked the fleeing Japanese. Although the damaged "Yorktown" and the destroyer "Hammann," which was aiding it, were fatally torpedoed by a submarine on June 6, the score was heavily against the Japanese, for United States carrier planes sank the carriers "Akagi," "Hiryu" and "Kaga" and the heavy cruiser "Mikuma," while the carrier "Soryu," which was damaged by carrier planes, was later sunk by the submarine "Nautilus." These losses, plus damage to other ships, were the first serious setback to the Japanese fleet since the outbreak of the war.

4. Solomon Islands Campaign.-The landing of the U.S. 1st marine division, reinforced, on Guadalcanal and Tulagi Islands in the Solomons on Aug. 7, 1942, marked the first Allied offensive move in force in the Pacific war. In this so-called offensive-defensive phase of the war, United States forces had seized the initiative, though progress was slow since they were still obliged to use a large part of their efforts to defend recent gains. Just before the battle of the Coral sea in early May the Japanese were occupying Tulagi Island in the Solomons, and in July they began the construction of an airfield on Guadalcanal, from which land-based planes could have endangered Allied control of the New Hebrides and New Caledonia. This penetration toward Allied lines of communication to Australia and New Zealand represented a peril that had to be stopped at all costs, and prompt steps were taken to eject the Japanese from that area.

This operation, under the command of Vice-Adm. R. L. Ghormley, involved moving the marines, under Maj. Gen. A. A. Vandergrift, from New Zealand, with naval surface and air support. The landings on Aug. 7 took the Japanese by surprise, and good progress was made in the early stages. Later the Japanese reacted strongly, and for many months there followed intense ground fighting, with fre-

Pacific fleet carrier U.S.S. "Yorktown" after a direct hit from Japanese planes which braved a barrage of anti-aircraft fire during the battle of Midway, June 3-6, 1942. Despite the U.S. loss of two carriers, the Japanese suffered their first naval setback of World

quent actions at sea between the fleets that were endeavouring to reinforce and support the opposing land forces. An initial reverse occurred in the battle of Savo Island in the early hours of Aug. 9, when Japanese cruisers and destroyers attacked Allied naval forces protecting the landings, and sank the cruisers "Quincy," "Vincennes," "Astoria" and "Canberra." After this action the U.S. positions were under frequent attack from air and sea, but the marines held their ground, and in a battle beginning on Aug. 20 were successful in repelling counterattacking Japanese troops. In anticipation of a further Japanese reinforcement, Vice-Admiral Ghormley concentrated southeast of Guadalcanal two task forces, which included the carriers "Saratoga" and "Enterprise," the battleship "North Carolina," cruisers and destroyers. On Aug. 24 contact was made with a powerful Japanese force, and the battle of the eastern Solomons ensued, during which planes from the "Saratoga" sank the Japanese carrier "Ryujo." Marine and army land-based planes joined in, and the Japanese, after the loss of carrier support, broke off the action, although not before inflicting damage on the "Enterprise."

During the next six weeks, no major action took place in the Solomons, although Japanese planes and submarines, which were harassing U.S. supply lines, were responsible for the loss of the carrier "Wasp" and several destroyers. The Japanese also succeeded in reinforcing their positions on Guadalcanal by almost nightly runs of the so-called "Tokyo express." On the night of Oct. 11-12 United States cruisers and destroyers, in a surprise attack, engaged a sizable force in the battle of Cape Esperance, near Guadalcanal, but the Japanese showed no signs of discontinuing their efforts to launch a full-scale attack. A fortnight later, on Oct. 26, while Japanese troops were actively attacking the marine positions on Guadalcanal, the carriers "Hornet" and "Enterprise" exchanged blows with carriers operating with a powerful naval force moving to support land operations on Guadalcanal. In this action, known as the battle of Santa Cruz Island, although damage was done to Japanese carriers, the United States carrier "Hornet" was lost.

The climax of sea fighting in the Solomons came in the battle of Guadalcanal, Nov. 13-15, 1942, when the Japanese, having concentrated an invasion force at Rabaul. were met by United States naval forces (covering reinforcements for troops on Guadalcanal) and defeated in a series of violent engagements which caused heavy losses on both sides. On Nov. 11 and 12, two contingents of reinforcements and supplies were landed at Guadalcanal. When strong Japanese forces were located approaching Guadalcanal from the northwest, a force of cruisers and destroyers under the command of Rear Adm. D. J. Callaghan (who was, with Rear Adm. Norman Scott, killed in the ensuing action) was assigned to fight a delaying action to cover the withdrawal of the transports and cargo vessels. Shortly after midnight on the morning of Nov. 13 the opposing forces met in a surface engagement of great violence. During the 24 min. that it lasted, gunfire was exchanged at close range, and though the Japanese battleship "Hiyei" was lost in consequence of this action, so were the United States cruisers "Atlanta" and "Juneau," as well as several destroyers.

On the morning of Nov. 14 Japanese cruisers and destroyers shelled Henderson field on Guadalcanal, and an invasion force, preceded by an escort of battleships, cruisers and destroyers, was discovered to the north of the island. This was subjected to air attack throughout the

753

day, and on the evening of Nov. 14 the battleships "Washington" and "South Dakota" and the carrier "Enterprise" reached the scene of the action. Shortly after midnight, contact was made north of Savo Island, and in another fierce night action, which resulted in the loss of the Japanese battleship "Kirishima" and three United States destroyers, the Japanese were turned back. Although United States losses were heavy, the battle of Guadalcanal was decisive in that U.S. positions in the southern Solomons were never again seriously threatened. After this action, United States forces on Guadalcanal retained the offensive, gradually driving the Japanese westward.

On Nov. 30 a Japanese effort at reinforcement was broken up by the battle of Tassafaronga (Lunga point), although at the cost of the loss of the cruiser "Northampton." Through December and January the Japanese ground forces found themselves in an increasingly unfavourable position, as U.S. troops were reinforced, and the 1st marine division was gradually replaced by fresh army forces. However, in anticipation of another Japanese effort to retake the island, Admiral Halsey (who had replaced Vice Admiral Ghormley as commander, South Pacific force, on Oct. 18) maintained considerably augmented naval forces in adjacent waters. On Jan. 29, 1943, the heavy cruiser "Chicago," escorting a convoy from New Caledonia to Guadalcanal, was torpedoed and sunk; but no further major action developed in the southern Solomons since on the night of Feb. 7-8, 1943, exactly six months after the initial U.S. landings, the Japanese withdrew their remaining forces from Guadalcanal. So ended the first Allied offensive campaign of the Pacific war.

5. Defensive War in the Atlantic.—When the year 1942 opened, the Allied navies were fighting a defensive war in the Atlantic, as they were in the Pacific. The Germans, who had been unable in their years of rearmament to build up a powerful and balanced fleet, had concentrated upon submarine construction and counted upon this underseas force to cut the sea routes to Great Britain. The German U-boat campaign followed the submarine strategy of World War I, which had been so nearly successful in isolating the British Isles. As the basic Allied strategy of the war called for the defeat first of Germany and then of Japan, it was essential that the control of Atlantic sea lanes be maintained to ensure the safe passage to Great Britain of U.S. troops and supplies. The shipment of supplies to Russia could be accomplished only through the northern ports of Murmansk or Archangel and required naval protection against German forces based in Norway, while the royal navy had heavy commitments to maintain the vital supply line to the Mediterranean.

Germany was able to operate a large number of submarines in the Atlantic, and sustained attacks on German shipyards by the British bomber command did not appear materially to have reduced production. In the winter and spring of 1942 submarine attacks were extended westward to the Atlantic coast of the United States and continually reduced the available total of Allied tonnage throughout the rest of the year. At that point increased Allied forces, improved antisubmarine measures and the growing production of U.S. and British shipyards turned the tables, and from 1943 onward new construction of merchant ships far outweighed the tonnage sunk by German submarines.

The battle of the Atlantic was a war of wits and of scientific devices, in which new measures and countermeasures were constantly evolved by the opposing navies,

but upon its success depended the outcome of the military operations that eventually led to the defeat of Germany. Its pattern throughout the entire war may most clearly be seen in the following statistical table included in Adm. Ernest J. King's third report to the secretary of the navy:

Year	German submarines	Allied shipping	N	ew constru	ction	Net gains or losses
, eui	Sunk	sunk	U.S.	British	Total	
	(Number)		(In thou	sands of	tons)	
1939 (4 months)	. 9	810	101	231	332	-478
1940		4,407	439	780	1,219	-3,188
1941	0.5	4.398	1.169	815	1,984	-2.414
1942	0.5	8,245	5,339	1,843	7,182	-1.063
1943	007	3,611	12,384	2,201	14,585	+10.974
1944	241	1,422	11.639	1,710	13,349	+11.927
	. 153	458	3,551	283	3,834	+3,376
Totals	. 782	23,351	34,622	7,863	42,485	+19,134

Although the major German naval effort was devoted to submarine warfare, German shore-based aircraft were a menace to shipping, and a small number of powerful surface ships had to be taken into account. On Feb. 12, 1942, the German battleships "Scharnhorst" and Gneisenau" and the cruiser "Prinz Eugen" made a successful dash from Brest, France, through the English channel to German waters, despite gallant attacks by British destroyers and Swordfish aircraft. The new battleship "Tirpitz," based in Norway, with cruisers, destroyers, submarines and aircraft, constituted a continuing menace to Allied north Russian convoys, which ran a gauntlet on every voyage requiring a strong covering force. The protection of these convoys was the main task of the British home fleet, which was from time to time augmented by U.S. heavy ships. Particularly vicious attacks were made upon these north Russian convoys in July and Sept. 1942, and during the last quarter of 1942 they were discontinued because of the requirements of shipping and escorts elsewhere. When they were resumed in December the Germans were on the alert, and on Dec. 31, 1942, a convoy was attacked by the German pocket battleship "Lutzow," the cruiser "Hipper" and six destroyers. In a series of short, sharp engagements, these forces were held off for four hours by six British destroyers commanded by Capt. Robert Sherbrooke, and eventually were driven out of the area by two 6-in.-gun cruisers of Rear Adm. Sir R. Burnett's covering force.

In Sept. 1943, royal navy volunteers manning midget submarines entered Aalten fjord, Norway, and torpedoed the "Tirpitz," putting it out of action for six months; on April 3, 1944, when repairs were advancing, fighters and bombers of the naval air arm operating from carriers attacked the battleship again and mauled it severely, thus neutralizing one of the potential threats to the north Russian convoys. The "Tirpitz" was attacked three times in July and Aug. 1944 by carrier planes and finally sunk on Nov. 12, 1944, by royal air force bombers.

The most dramatic action of the royal navy in arctic waters occurred on Dec. 26, 1943, when the German battleship "Scharnhorst" attempted to molest a convoy. Adm. Sir Bruce Fraser was at sea with the battleship "Duke of York" and other ships, providing distant cover for a convoy escorted by four cruisers under Rear Admiral Burnett. The "Scharnhorst" was sighted when the convoy was to the southeast of Bear Island, and was shadowed by the British cruisers, while the "Duke of York" moved up from the southwest at high speed to intercept. The British battleship obtained a hit at long range, and the "Scharnhorst" was prevented from escaping by destroyers which delivered a torpedo attack that reduced its speed enough to allow the "Duke of York" to close the range and renew the battle. In a short time the German battleship had been set on fire and almost stopped, and it was then sunk, 60 mi. northeast of North Cape,

Throughout 1942, while the German navy was impeding the progress of north Russian convoys in Norwegian waters, the Italian navy constituted a potential threat to supplies and reinforcements in the Mediterranean. The fluctuations of the land fighting in the North African campaign emphasized the vital importance of a naval base in the central Mediterranean and the necessity of maintaining Malta at all costs. A Malta convoy got through in Jan. 1942, but the February convoy was driven back. On March 22, 1942, Vice-Adm. Sir Philip Vian, with inferior forces, outwitted and repelled a larger Italian naval force. The convoy that he was covering, though subsequently attacked by German aircraft, got through to Malta. In the spring Spitfires were flown in to the island from carriers that penetrated the Mediterranean, the United States carrier "Wasp" taking part in these operations with the royal navy. In June an attempt was made to relieve Malta simultaneously from the west and from Gibraltar, and in August a heavily escorted convoy was sent from England. Although these attempts involved heavy fighting and losses and were only partially successful, some ships got through, and by September the situation at Malta had improved. The Italian navy at no time made adequate use of its extensive resources, and until its surrender in the autumn of 1943 remained in the character of a potential

inferior British Mediterranean naval forces.

During the defensive period of 1942, two operations of very limited scope against the continent of Europe were attempted. On March 27–28 an attack was made upon the French port of St. Nazaire to put the graving docks there out of action; the British destroyer "Campbeltown," loaded with high explosives, rammed the lock gates and scuttled itself. On Aug. 19 a commando raid upon Dieppe was carried out, with very heavy casualties. Though continuous fighter cover was maintained by the royal air force, this raid indicated the necessity of being able to support landings of troops by naval gunfire.

threat rather than a true adversary of the numerically

6. Amphibious Assaults upon North Africa and Europe.—World War II was characterized by a series of successful amphibious operations of unparalleled magnitude, which were made necessary by the geographical extension of axis aggression on both sides of the world. In the Pacific, the Japanese could be reached only by crossing thousands of miles of ocean. In Europe, the rapid successes of German arms in 1940 had driven the Allies from the continent and had penetrated Africa. There also, Allied ground troops could come to grips with the axis only after transportation over water and landings on hostile shores. Amphibious landings required the most complicated planning and co-ordination between the various branches of the aimed forces of the United States and Great Britain.

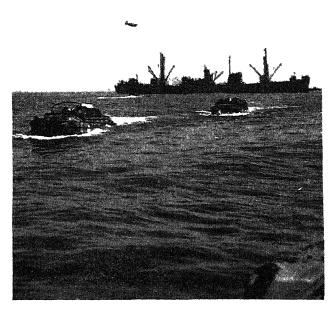

(a) North Africa. The combined chiefs of staff decided in July 1942 to effect landings in force in French North Africa in the autumn of that year, and to postpone the assault upon the continent of Europe until a later date. Lieut. Gen. Dwight D. Eisenhower was appointed commander in chief of the Allied force, with Adm. Sir Andrew Browne Cunningham as his principal naval subordinate. Three points were to be attacked: Oran and Algiers by U.S. army troops supported by British naval forces, and Casablanca by U.S. troops under Maj. Gen. George S. Patton, Jr., supported by naval forces commanded by Rear Adm. H. Kent Hewitt, who commanded United States naval units in all subsequent amphibious operations in the Mediterranean. The Oran and Algiers forces proceeded from the British Isles, but the Casablanca force came en-

tirely from United States ports and crossed the Atlantic without untoward incident. Landings were made early in the morning of Nov. 8, and though there was resistance ashore and a naval action off Casablanca with French ships, good progress had been made before an aimistice was negotiated with the French forces on Nov. 11. By this operation, the largest overseas expedition ever dispatched to that time, the axis was denied the use of northwest Africa, and ports and bases had been secured which were essential for the control of the Mediterranean and subsequent entry into Europe.

(b) Sicily and Italy.—Within six months after the North African landings, German forces had been driven from Tunisia, and Allied strength was augmented to a point that made it possible to plan for a movement across the Mediterranean into axis territory. During May and June naval forces were assembled at Algerian and Tunisian ports for the invasion of Sicily. The specially designed landing craft, which allowed the landing of troops and tanks directly upon assault beaches, had just begun to emerge from U.S. and British shipyards and were used for the first time in large numbers in the Sicilian operation. The larger types of these craft were capable alike of crossing the ocean under their own power and beaching themselves in shallow water for the discharge of their loads by means of ramps. The development of these highly specialized vessels contributed immeasurably to the amphibious successes of the war.

Landings took place on July 10, the United States forces having objectives at Scoglitti, Gela and Licata, on the south coast of Sicily, while British forces attacked beaches

Cargo ship laden with supplies for U.S. troops ashore at Anzio after the invasion of Jan. 1944. The vessel lay at anchor, guarded from sea or air attack by amphibious craft (foreground) and a barrage balloon overhead

755

on the southeastern coast. Naval gunfire was extensively used before the landings; and for several weeks afterward, as troops were pushing across the island toward Messina, cruisers and destroyers assisted them by bombarding axis positions.

Messina was occupied on Aug. 17; with Sicily under control, immediate invasion of the Italian mainland was planned. British forces began crossing the Straits of Messina, and to assist them in their advance up the Italian peninsula, amphibious landings were made in the Bay of Salerno on Sept. 9. In spite of counterattacks, some of which naval fire succeeded in breaking up, the port of Saleino was captured on Sept. 10, and on Oct. 1 Allied troops entered Naples.

After the Italian surrender, the greater part of Italy's fleet sailed to Malta to surrender, arriving on Sept. 11. Thus ended the astonishing and ignominious career of a powerful navy, which gave no useful account of itself in the day of battle. The Mediterranean was free once more of axis surface vessels, though German aircraft were still to be reckoned with.

There were no further amphibious operations against the Italian peninsula on the scale of the Sicilian and Salerno landings, although on Jan. 22, 1944, a joint force landed at Anzio, south of Rome, and established a beachhead behind the German lines. Resistance and counterattacks were so severe that it required great effort to support the troops at this point.

(c) The Normandy Landings.—In Jan. 1944 General Eisenhower arrived in Britain from the Mediterranean and assumed the duties of supreme commander. Allied expeditionary force. His principal naval subordinate in the planning for the cross-channel invasion of France was Adm. Sir Bertram H. Ramsay, designated as Allied naval commander in chief. The site chosen for the attack was the Baie de la Seine in Normandy, near the ports of England and within easy range of fighter-plane bases; but, since there was no adequate harbour for a quick build-up after the initial assault, it was necessary to devise artificial harbours which could be quickly constructed once the beachhead was secured. This involved a naval problem of great magnitude. Added to the large numbers of ships and craft needed to move the troops and their supplies were those necessary to tow the hollow concrete caissons that had been secretly built in England for sinking at designated points to establish breakwaters. The scale of the operation was indicated by the fact that 5,000 ships and about 200,000 officers and men of the Allied navies and merchant fleets were involved. After the first landing about 2,000 merchant ships (totalling 4,000,000 tons) were continually employed in supplying the armies.

The beaches on the western half of the Baie de la Seine were assigned to United States troops, landed from U.S. vessels, while the eastern half of the area was taken by British and Canadian troops, transported chiefly in British vessels. Loading of troops began on June 1, 1944, and by June 3 all had been loaded and briefed. D day had been initially set for June 5, but because of unfavourable weather was postponed 24 hr. This great armada, setting sail from various ports in the British Isles upon an intricately timed and involved schedule, was preceded by great numbers of mine sweepers, clearing the channels, and by about 80 fire support vessels—battleships, cruisers and destroyers—which brought 800 guns, ranging in calibre from 4-in. to 16-in., to batter shore defenses and cover the landing of the troops. On June 6 the initial landings

took place, substantially according to schedule, closely tollowed by the build-up convoys of transports and cargo ships. On June 7 all the elements of the artificial harbours, or "Mulberries" as they were called in code, had been towed from England, and the work of installation became

For many days after the landings, while the Allied troops were still within range of ships' guns, the battle-ships, cruisers and destroyers furnished highly useful fire support, and on June 25 Cherbourg was bombarded to assist the army forces that were advancing on the port from the land side. Cherbourg fell on June 27, and naval salvage forces began clearing the port, as they subsequently did at Le Havre when that city surrendered on Sept. 12. The build-up following the invasion proceeded so rapidly that 100 days after the initial landings more than 2,000,000 men, nearly 500,000 vehicles and 4,000,000 tons of stores had been landed in France; and the Allied armies were far advanced in their drive across France to Germany.

(d) Southern France.—Landings on the south coast of France were also involved in the plan for the penetration of the continent, and consequently the fire support ships and landing craft of the Normandy invasion were deployed to the Mediterranean as soon as they could be spared from the English channel operations. On Aug. 15 United States and French troops were put ashore on beaches near St. Tropez, Fréjus and St. Raphael, on the southern coast of France in the area between Toulon and Nice. These operations, of which the naval commander was Vice-Admiral Hewitt, were successful in establishing a firm beachhead. With strong air support, the army pressed rapidly inland up the Rhône valley and eventually effected a junction with troops from the Normandy beachhead. By the end of August Toulon and Marseille had surrendered, and by the end of September the last beaches were closed and the amphibious phase of the campaign had ended.

With no further large-scale amphibious operations in prospect in the area, ships left the Mediterranean as rapidly as possible for further service in the Pacific. Though naval forces assisted in the crossing of the Rhine river in March 1945, and in various coastal operations in France and Germany, the war in Europe passed into the hands of the Allied air and ground forces. The United States navy was free to concentrate its attentions upon the Japanese, while the royal navy prepared to send a force to the Pacific to assist in operations there.

7. Offensive-Defensive in the Pacific.—Although the landings in the Solomon Islands in Aug. 1942 had wrested the initiative from Japan, progress in the Pacific was necessarily slow for more than a year thereafter. When the Japanese evacuated Guadalcanal on Feb. 8, 1943, it remained to eject them from the northern Solomons, and then (as it seemed at that time) from an almost endless chain of island positions. The Japanese had held some of the latter since World War I and had fortified them in defiance of mandate agreements.

Throughout the spring of 1943 naval forces bombarded Japanese positions in the central Solomons, while the Japanese still continued air attacks upon Guadalcanal. On June 30 amphibious landings were made on Woodlark and Trobriand Islands (between the Solomons and New Guinea), at Nassau bay on New Guinea and at Rendova harbour and Viru harbour in the central Solomons. On July 2 and 3 landings were made on New Georgia and at Vangunu Island near by. This movement to the northward soon brought contact between United States naval forces and the "Tokyo expresses" that were making nightly

runs to supply and reinforce Japanese positions in the central Solomons. The battle of Kula gulf on July 6 and the battle of Kolombangara (also called second battle of Kula gulf) on July 12–13 discouraged interference with U.S. operations on New Georgia and prevented the Japanese from using Kula gulf as a route for supply runs. The former action, however, resulted in the loss of the cruiser "Helena," and the latter in the loss of the destroyer "Gwin" and damage to other ships.

The capture of Munda airfield on Aug. 5, six weeks after the invasion of New Georgia, marked the climax of the central Solomons campaign, which ended with the Japanese evacuation of Kolombangara and Vella Lavella Islands on Oct. 6.

8. The Pacific Offensive.—In the autumn of 1943, United States strength in the Pacific had reached a point where it was possible for the army and navy to attack at points of their own choosing. Allied strategy called for an advance upon the core of the Japanese positions from two different directions, which, reduced to the simplest terms, consisted of a movement northward from Australia by forces under the command of Gen. Douglas MacArthur, and a thrust westward across the central Pacific from the Hawaiian Islands by forces under the command of Admiral Nimitz. During the next year these two great advances from different points in the Pacific rapidly converged, finally closing in a gigantic pincer movement upon the Philippine Islands in Oct. 1944. From that point onward, there was but a single route to Tokyo.

Both routes involved a constant succession of amphibious landings, though in the move northward from Australia the large land masses of New Guinea entailed a greater amount of ground fighting than in the central Pacific, where the distances were greater and the island groups of diminutive size. The central Pacific campaign consequently offered more points of naval interest, for it was there that the technique of the fast carrier striking forces was evolved.

In Oct. 1942 United States carrier strength was at its lowest point; four of the seven U.S. aircraft carriers in commission at the outbreak of war had been lost in the Pacific. New and more powerful types were, however, under construction in large quantities, and by the late summer of 1943 a sufficient number had joined the fleet to make large-scale offensive operations possible. Since the battle of Midway in June 1942 there had been no naval operations of importance in the central Pacific. At the time of Midway, the Japanese, in a thrust into the north Pacific, had occupied Kiska and Attu in the Aleutians; but Attu had been recaptured by United States forces in May 1943 and Kiska was reoccupied in Aug. 1943 after its evacuation by the Japanese. The North Pacific was therefore no longer a threat, but in the central Pacific the Japanese were thoroughly established in the Marshall, Gilbert, Caroline, Palau and Marianas Islands. The great distances between groups of islands required the development of a special technique for attack. The new carriers, accompanied by fast battleships and cruisers, were formed into mobile striking forces that were able to travel far afield, deliver a powerful attack from the air, or by naval gunfire, and give a good account of themselves with any Japanese ships that might be encountered.

(a) Gilbert and Marshall Islands.-In Aug., Sept. and

Advance units of the U.S. marine corps wading across a reef on the shore of Tarawa during the invasion of Nov. 1943

Oct. 1943 the first large-scale carrier-based air strikes were made against Marcus Island, Tarawa in the Gilbert group, Apamama and Wake Island. Following in rapid succession, they were designed to soften Japanese installations and to confuse the Japanese as to U.S. intentions. During October and November major units of the Pacific fleet were placed under the command of Vice-Adm. Raymond A. Spruance, who was designated commander, central Pacific force (later commander, 5th fleet); and plans were made for an amphibious assault upon the Gilbert Islands. This group of coral islands, lying athwart the equator, which had been seized by the Japanese from the British in Dec. 1941, was of great strategic importance since it lay to the north and west of Allied bases in the South Pacific and to the south and east of Japanese bases in the Caroline and Marshall Islands. During the second week in November, the central Pacific force headed west from the Hawaiian Islands and on Nov. 20, 1943, attack groups were off Tarawa and Makin Islands in the Gilberts. After heavy shore bombardment, army units were put ashore on Makin and marines on Tarawa. The fighting on Tarawa was particularly severe and casualties were heavy, but after four days the island was captured. The capture of Makin was announced on Nov. 22. Upon completion of the assault phase of the operation, the naval covering forces withdrew to their bases, en route to which carrier task groups attacked Kwajalein and Wotje atolls in the Marshall Islands, where future landings were projected. During the remainder of the year army and navy land-based planes continued to attack positions in the Marshalls.

On Jan. 29, 1944, Admiral Spruance's forces began the most intensive offensive operations yet conducted against the Marshall Islands. Carrier planes simultaneously struck Kwajalein, Roi, Taroa and Wotje, while cruisers bombarded Taroa and Wotje, and shore-based aircraft bombed all four islands as well as Mille and Jaluit. The attacks were resumed the next day, with battleship bombardment of Kawajalein and Roi in addition. On Jan. 31 an unopposed landing was made on Majuro, and on Feb. 2 landings were made on Roi, Namur and Kawajalein. Resistance on Roi and Namur was quickly overcome; although it was stiffer on Kawajalein, that entire atoll was secured by Feb. 8.

It was now possible for Admiral Spruance's forces to venture further with impunity. His fast carriers, battleships, cruisers and destroyers on Feb. 17–18 carried out an attack upon the Japanese base at Truk, far to the westward in the heart of the Caroline Islands. Similar strikes against the western Carolines were made at the end of March, when carrier-based planes attacked shipping in the Palau group on March 30 and 31, while others attacked Yap and Ulithi. In April these forces were in New Guinea waters, in support of General MacArthur's assault upon Hollandia. For an understanding of the significance of this operation, it is necessary to leave the central Pacific temporarily, and turn back to the beginning of accelerated operations in the South and Southwest Pacific.

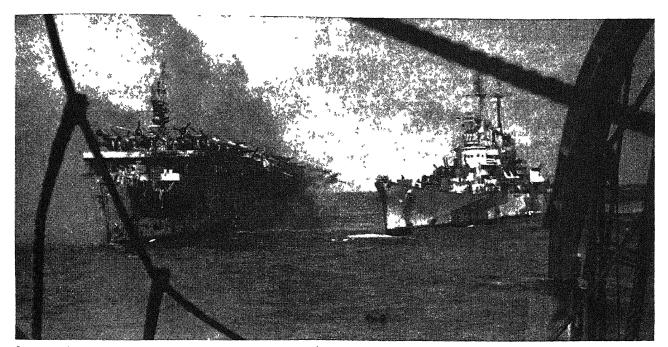

(b) New Guinea.—While forces of the South Pacific area were attacking the central Solomons in the summer of 1943, General MacArthur's troops in the Southwest Pacific were launching powerful attacks in New Guinea to the westward. Landings had taken place at Nassau bay on June 30. Early in September amphibious forces moved against the Huon gulf area. On Sept. 11 Salamaua was captured, and Lae fell five days afterward. Finschhafen was captured on Oct. 2.

With the conclusion of the central Solomons campaign, South Pacific forces continued the northward advance through the Solomons in order to protect the eastern flank of the Allied troops in New Guinea and to aid in the ultimate isolation of the Japanese stronghold in the Rabaul-Kavieng area. At the end of October, United States marines landed at Empress Augusta bay, on the west coast of Bougainville, and so established a position in the northern Solomons. The intention there was not so much to eject the Japanese from Bougainville as to gain a perimeter in which air facilities could be established for attacking the port of Rabaul, which had until that time been in a key position to control the area to the south. On Nov. 5, and again in the following week, carrier forces of the Pacific fleet attacked Rabaul, and during the last ten days of December it was struck by land-based planes operating from bases in the Solomons. Carrier strikes were made against Kavieng, another important base on the northern tip of New Ireland, on Dec. 25 and 28, 1943, and Jan. 1,

Amphibious landings were made on the western end of New Britain Island at Arawe on Dec. 15 and at Cape Gloucester on Dec. 26, while on Jan. 2 an unopposed landing was made at Saidor on the New Guinea coast. On Feb. 13, 1944, the final occupation of the Huon peninsula in northeast New Guinea was completed by United States and Australian troops. Thus, from the Solomons (to the eastward) and from New Guinea (to the westward) Allied pincers were closing upon Rabaul. Although not directly assaulted and captured, its usefulness was neutralized, and it no longer represented a major threat to Allied progress along the northern coast of New Guinea. Landings were made on Green Island, 120 mi. from Rabaul, on Feb. 15, on the Admiralty Islands on Feb. 29 and on Emirau (in the St. Matthias group north of New Britain) on March 20. The capture of the Admiralty Islands, which established Allied forces in a position to interfere with Japanese supply lines to the Bismarck archipelago from the north, isolated large numbers of troops in the region.

This same leapfrog strategy was pursued with telling effect by General MacArthur in a series of amphibious landings which carried his troops westward along the northern coast of New Guinea. In accordance with it, the next major bypassing move was directed at the coastal area in the vicinity of Aitape and Hollandia, about 200 mi. beyond Wewak, where the Japanese had concentrated a considerable force. The assault on Hollandia involved three separate attacks; one at Tanahmerah bay and a second at Humboldt bay (30 mi. to the eastward) secured the Hollandia airstrips, while a third at Aitape (90 mi. to the eastward) won another airfield. On April 21 the Pacific fleet carriers that were supporting the operation attacked the area, which had previously been bombed for some days by land-based aircraft. The actual landings, which took place on April 22, were virtually unopposed. By this operation approximately 50,000 Japanese troops were cut off, and airfields indispensable for future progress were

Returning north from the support of the Hollandia landings, the fast carrier task force attacked Truk again on April 29 and 30, carrier planes dropping 740 tons of bombs on land installations. Similarly, cruisers and destroyers of the force bombarded Satawan Island on April 30, while battleships and destroyers bombarded Ponape on May 1. The task force then returned to the central Pacific, in anticipation of impending operations against the Marianas Islands, for which preparations had begun as soon as bases in the Marshall Islands were secured.

Rescue workers aboard a cruiser directing streams of water at the light carrier U.S.S. "Princeton," hit by Japanese bombs during the battle of Leyte gulf in Oct. 1944, and later sunk

(c) The Marianas; Battle of the Philippine Sea.—The Marianas Islands provided the Japanese with a series of highly useful airfields and bases that afforded protected lines of air and sea communication to distant possessions. Allied occupation of the group would not only hamper Japanese communications, but provide United States forces with bases from which aircraft could bomb Tokyo; also, the sea areas farther to the west could be controlled. The operation for the capture of the Marianas, which involved more than 600 ships, 2,000 aircraft and 300,000 navy, marine and army personnel, was under the command of Admiral Spruance, who had already conducted the Gilberts and Marshalls operations. Japanese air bases on Marcus Island and Wake Island to the northward, which might have threatened the operation, were attacked by carrier planes, cruisers and destroyers during the third week in May 1944. Marcus was struck on May 19 and 20 and Wake on May 23. From the beginning of June, landbased aircraft from the Admiralty Islands and Hollandia kept neighbouring bases at Truk, Palau and Yap under attack, while the fast carrier task force began attacks on the Marianas on June 11. As the island of Saipan had been in Japanese hands since World War I, it was formidably fortified; and an intensive attack was necessary before landings could take place. Surface ships began bombardment on June 13, and early on the morning of June 15 marine and army troops were put ashore. The Japanese resisted vigorously; and, though initial beachheads were established, progress inland was slow.

At this point it became apparent that the Japanese fleet was en route to the Marianas, apparently bent upon provoking a full-scale action. This presented a problem in objectives, for although Admiral Spruance's ships and planes were entirely ready and able to meet the Japanese at sea, his basic mission was to capture the Marianas, and therefore the forces attacking Saipan had to be protected from interference at all costs. In consequence, he operated aggressively to the westward of the Marianas, but did not move so far away from the islands that he could not protect the amphibious forces from any possible attack.

While some of the fast battleships and carriers were operating to the westward in anticipation of the arrival of the Japanese fleet, other carriers went north and struck Iwo Jima and Chichi Jima, thus eliminating temporarily the threat of air attack from the Bonin and Volcano Islands. Upon completion of this attack, the carriers rejoined Admiral Spruance's other ships west of Saipan.

On June 19, 1944, the battle of the Philippine sea began in the form of a large-scale attack by Japanese carrier aircraft on Admiral Spruance's fleet. Four hundred Japanese planes were shot down, with only very moderate United States air losses and minor damage to surface vessels, while the Japanese carriers, "Taiho" and "Shokaku" were sunk by United States submarines. Because of these substantial carrier plane losses, further Japanese attacks upon Saipan seemed unlikely; and Admiral Spruance's forces therefore headed to the westward in the hope of intercepting and destroying the Japanese fleet in a decisive engagement. Search planes did not locate the Japanese surface ships until afternoon, and it was nearly sunset by the time carrier strikes were launched. These attacks had to be made at extreme range; nevertheless, they sank the carrier "Hiyo," damaged the carrier "Junyo," sank two fleet tankers and damaged one. Nightfall cut short the attack. Although only a small number of United States planes were lost to Japanese anti-aircraft fire, 73 were lost while returning to their carriers when they ran out of fuel and crash landed in the darkness, although a high percentage of the personnel of planes that landed in the water near their carriers was rescued. The Japanese fleet continued its retirement during the night of June 20, and on June 21 was out of range. Though it had not been destroyed, its effort to reinforce the Marianas had been very thoroughly broken up, and its corps of carrier-plane pilots had been practically eliminated. Japanese naval aviation never entirely recovered from this severe blow. The occupation of the Marianas, in consequence of the battle of the Philippine sea, then proceeded without further threat of naval interference, although the land fighting on Saipan was bitter and protracted. All organized resistance finally ceased on the island on July q.

Landings on the neighbouring island of Guam (which

had been captured by the Japanese in Dec. 1941) had been scheduled for June but had been postponed because of the unexpectedly intense resistance on Saipan and the threat of the battle of the Philippine sea. Because of the postponement, a long period of preliminary bombardment and air attacks was possible, beginning on June 16. From July 8 until July 21, when U.S. troops landed, battleships, cruisers and destroyers shelled the island daily, while planes from fast and escort carriers, as well as from the newly won fields on Saipan, bombed defense installations. Japanese resistance, although stubborn, was less intense than on Saipan, and on Aug. 10 all organized resistance ended. Guam was rapidly developed as a naval and air base for further offensive operations.

Amphibious operations in the Marianas Islands were completed by the capture of Tinian, an island located across the narrow channel to the south of Saipan. There also there were heavy advance air and surface attacks before the actual landings, which began on July 24. Resistance was less severe there than in the other islands, and in a fortnight the assault and occupation phase was completed.

(d) The Carolines.—The next major objective in the central Pacific was the western Caroline Islands, the capture of which would complete the isolation of Truk and other Japanese positions in the central and eastern Carolines. This operation was commanded by Admiral Halsey (commander, 3rd fleet) who, having completed the mission in the South Pacific that had begun in Oct. 1942, thereafter alternated with Admiral Spruance in command of the great striking forces of the Pacific fleet. As new ships were constantly joining the fleet, the forces available for the western Carolines operation were even greater than those used in the Marianas; nearly 800 vessels were employed.

Prior to the landings, which were scheduled for Sept. 15, air and surface strikes were made in many directions to divert and eliminate Japanese forces that might have interfered. Attacks were made by the fast carrier task force on the Bonin and Volcano Islands, to the northward, between Aug. 31 and Sept. 2, and on Yap on Sept. 7 and 8. As the plan for a landing on Peleliu Island in the Palau group of the western Carolines by Admiral Halsey's forces was co-ordinated with a simultaneous landing on Morotai Island (between New Guinea and the Philippine Islands) by General MacArthur's forces, who had advanced the length of New Guinea, the fast carrier task force made strikes on Mindanao Island in the southern Philippines on Sept. 9 and 10 to prevent opposition from that direction. Because of the slight resistance encountered at Mindanao, further carrier strikes were made against the Visayas, in the central Philippines, from Sept. 12 to 14, which achieved tactical surprise and inflicted considerable damage on Japanese installations, ships and planes.

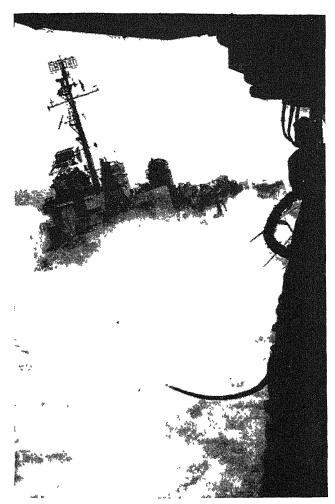

Preceded by three days of surface bombardment, air bombing, mine sweeping and clearing of beach obstacles, landings took place on Peleliu Island on Sept. 15, and on Angaur Island, six miles south of Peleliu, on Sept. 17. No landings were made on Babelthuap, the largest of the Palau group, since the bases obtained on Peleliu and Angaur made possible the domination of the group and neutralized Japanese ground forces on the other islands. Progress ashore on Peleliu was slow, and it was the middle of October before the assault phase of the operation was completed, but the island of Angaur was overrun by Sept. 20. An unopposed landing was made on Ulithi atoll on

Sept. 23, and steps were immediately taken to develop it as an anchorage for large surface forces.

Simultaneously with the landings on Peleliu, General MacArthur's forces landed on Morotai Island, in a move calculated to isolate Japanese forces on Halmahera Island, which were in a position to impede any movement into the southern Philippines. This operation was the result of a succession of amphibious landings that had been made along the north coast of New Guinea after the capture of Hollandia five months before. The landings, designed to prevent Japanese air and troop movements in New Guinea and to secure the southern flank of the offensive operations to the northward in the central Pacific, were in general not heavily opposed. Consequently, they involved the support of no ships larger than heavy cruisers, unlike the Hollandia operation in April, which had been supported by battleships and carriers of the Pacific fleet The Wakde Island area, 70 mi. west of Hollandia, was occupied on May 17-19, and on May 27 an amphibious assault was made on Biak Island to secure a forward base for the operation of heavy bombers. On July 2 a landing was made on Noemfoor Island, southwest of Biak, and on July 30 an amphibious force landed in the Cape Sansapor area on the Vogelkop peninsula in western New Guinea. Thus, during the spring and summer, General MacArthur's forces had reached the western extremity of New Guinea, neutralizing that great island as a base for Japanese operations and obtaining airfields that facilitated the attack on the southern approaches to the Philippines.

(e) Leyte.—After supporting the western Carolines landings, the fast carrier task force resumed the attack upon the Philippine Islands, making the first carrier strike of the war on Manila and Luzon Island on Sept. 21 and 22. On Sept. 24, carrier planes hit the central Philippines and photographed the area around Leyte and Samar, where landings were to take place in October. It had originally been planned to attack the Philippines at a somewhat later date, but Admiral Halsey's air strikes had revealed an unexpected weakness of Japanese defense in the islands, and, accordingly, the joint chiefs of staff, acting with the greatest rapidity, undertook to capitalize upon this situation. Plans were quickly revised, and preparations were made for the invasion of Leyte Island in the central Philippines on Oct. 20. The east coast of Leyte had a free undefended approach from the east, and adequate anchorages, as well as good access to the other islands in the cen tral Philippines. Moreover, the seizure of Leyte would bypass and isolate Japanese forces in Mindanao.

The Leyte operation marked the joining of the two advances upon Japan from different directions. It was under the command of General MacArthur, to whom Admiral Nimitz made available strong forces of the Pacific fleet Admiral Halsey's 3rd fleet covered and supported the landings by air strikes over the northern and central Philippines and Formosa and provided protection against an attack upon the landings by the Japanese fleet. Preparatory carrier strikes occupied the period from Oct. 0 to 20. The Ryukyu Islands (including Okinawa) were attacked on Oct. 9 and 10, northern Luzon on Oct. 11 Formosa and the Pescadores on Oct. 12 and 13. On Oct 13 and 14 a part of the fast carrier task force was attacked by Japanese planes and two cruisers were damaged. To prevent further attacks while these damaged ships retired U.S. carrier aircraft attacked airfields in Formosa and the northern Philippines repeatedly during Oct. 14 and 15 On Oct. 18 and 19 further strikes were made against objectives in the central and northern Philippines, and during and after the actual landings on Leyte some of the fast

Refuelling a destroyer during 1945 operations in the China sea. The U.S. carrier slacked its oil lines to reduce tension caused by the rough waters

carriers furnished direct support while others conducted searches for Japanese fleet units.

On Oct. 20, after heavy bombardment and air bombing, forces of the central Philippine attack force, commanded by Vice-Adm. Thomas C. Kınkaid (commander, 7th fleet, and General MacArthur's principal naval subordinate), went ashore on the east coast of Leyte Island. The initial landings were entirely successful, but they were soon challenged by the Japanese navy in a full-scale operation, designed to drive U.S. forces from the Philippines.

(f) Battle of Leyte Gulf.—There followed the battle of Leyte gulf, the greatest naval engagement of the war, which resulted in the complete and thorough defeat of the Japanese. This battle, which consisted of a series of surface and air engagements taking place between Oct. 23 and 26, culminated in three actions, designated as the battle of Surigao strait, the battle off Samar and the battle off Cape Engaño.

The Japanese attack came from three directions. One force (the southern) approached Leyte from the south through Surigao strait; another force (the central) came through San Bernardino strait, while a third (the northern) approached from the direction of Japan. As the battle of the Philippine sea had resulted not only in the sinking of three Japanese carriers, but in the virtual destruction of the air groups of three carrier divisions, the fleet had been reorganized for surface action. The Japanese

plan for driving U.S. forces from the Philippines was consequently dependent upon surface ships' provoking a decisive naval engagement. The only Japanese carriers involved were in the northern force, which was intended chiefly for a decoy since the only air support counted upon by the Japanese was from land-based planes.

Early in the morning of Oct. 23 the Japanese central force was discovered off Palawan by two United States submarines, "Darter" and "Dace." The "Darter" sank the heavy cruiser "Atago" and damaged the heavy cruiser "Takao," but in manoeuvring went aground and was itself lost. The "Dace" sank the heavy cruiser "Maya." On the following day 3rd fleet carrier planes located and attacked the central force in the Sibuyan sea and the southern force in the Sulu sea. In the course of the Sibuyan sea action heavy damage was inflicted, and the Japanese battleship "Musashi," equipped with 18-in. guns and one of the two largest battleships in the world, was sunk. Nevertheless, the central force pushed doggedly onward toward San Bernardino strait and Leyte. The Japanese southern force entered Surigao strait in the early hours of Oct. 25 and was annihilated there in a surface engagement with destroyers and battleships of the 7th fleet. The battleships "Yamashiro" and "Fuso" and three destroyers were sunk almost immediately in this battle of Surigao strait, which was one of the few actions of the war in which aircraft did not participate.

The central force, having passed through San Bernardino strait, moved southward off the coast of Samar and shortly after daybreak attacked a group of lightly aimed escort carriers of the U.S. 7th fleet. This battle off Samar was finally broken off by the retirement of the greatly superior Japanese force.

During the night of Oct. 24-25, Admiral Halsey's carrier task force had been moving northward to meet the Japanese northern force. In the resulting battle off Cape Engaño the Japanese carriers "Zuikaku," "Zuiho," "Chitose" and "Chiyoda" were sunk; but upon receiving word of the battle off Samar, Admiral Halsey sent a detachment of carriers and battleships to assist the 7th fleet escort carriers. These ships were unable to intercept the retiring Japanese central force before it had re-entered San Beinardino strait, but on the afternoon of Oct. 25 and during Oct. 26 carrier planes attacked the fleeing Japanese and inflicted further damage. At the end of the battle of Leyte gulf, three Japanese forces had either been destroyed or had retired out of range. While 6 U.S. vessels (the light carrier "Princeton," 2 escort carriers, 2 destroyers and 1 destroyer escort) had been sunk, the Japanese had lost in the course of the battle 3 battleships, 4 carriers, 10 cruisers and 9 destroyers—a total of 26 combatant ships. The battle of Leyte gulf represented the end of the Japanese navy as a powerful element in the Pacific war.

During the remainder of 1944 no major naval actions developed, but the fast carriers were constantly employed in support of the Leyte campaign; and, because of delays in establishing airfields on shore, because of unfavourable weather, naval aircraft gave direct support to the troops on Leyte for a considerably longer period than had been anticipated. Manila and other targets on Luzon were attacked repeatedly. In furtherance of the Leyte operation, an amphibious landing was made at Ormoc bay, on the west coast of the island, on Dec. 7, while on Dec. 15 a further landing was made on Mindoro Island, nearly 300 mi. to the northwest.

(g) The Philippines.-The attacks upon Manila in De-

cember had caused the Japanese to expect landings in that area, but the next large amphibious operation entirely bypassed Manila and was directed against Lingayen gull, in the northern part of Luzon Island. In preparation, the 3rd fleet attacked Formosa and the southern Ryukyu Islands on Jan. 3 and 4, 1945; and on Jan. 9, while troops were going ashore on beaches in the Lingayen gulf area, Formosa was again attacked by carrier planes. A thrust by the fast carrier task force into the South China sea then followed, during which the coast of Indo-China between Saigon and Camranh bay was attacked on Jan. 12, Formosa on Jan. 15 and Hong Kong and Canton on Jan. 16. The complete inability of the Japanese to resist the movements of the United States navy on the very shores of the continent of Asia was indicated by the fact that Admiral Halsey's forces traversed 3,800 mi. in the South China sea during this series of attacks without receiving damage to any

Although U.S. forces were securely established in the Philippines, large land areas and innumerable islands remained to be cleared; and until the end of the war land fighting, accompanied by amphibious landings, was going on in various parts of the group. Landings to accelerate the capture of Manila were made in the vicinity of Subic bay on Jan. 29 and 30 and at Nasugbu, south of Manila bay, on Jan. 31. On Feb. 13 cruisers and destroyers bombarded the entrances to Manila bay; on Feb. 15 troops landed on the Bataan peninsula and on Feb. 16 on Corregidor Island—the scenes of bitter United States reverses three years earlier. Subsequent operations were undertaken to gain control of the straits leading into the waters of the central Philippines and to seize coastal cities and strongly held Japanese positions in various central and southern islands. Landings were made at Zamboanga on Mindanao Island on March 10, at Iloilo on Panay Island on March 18 and at Cebu Island on March 26. On April 17 a landing at Malabang in southern Mindanao resulted in the seizure of the important Davao gulf area. In May similar operations were extended to the westward into Borneo to recover Japanese conquests in the Netherlands Indies and cut off Japanese oil supplies. The first Borneo landings were against the island of Tarakan on May 1; the second large operation was against the Brunei bay area on the northern coast on June 10, and on July 1 a large amphibious force attacked Balikpapan on Makassar strait.

(h) Attacks on the Home Islands.—While the Philippine Islands were still being fought over, the war was simultaneously being carried not only to the inner defenses of the Japanese empire but to the home islands themselves. The occupation of the Marianas Islands in the summer of 1944 had furnished bases from which U.S. long-range bombers could attack Japan, but to increase the effectiveness with which these planes could operate, fighter support was desirable. The island of Iwo Jima in the Volcano Islands, only 750 mi. from Tokyo, offered an ideal site for a fighter base to support the Marianas-based B-29's, as well as for the operation of medium bombers. An amphibious assault upon Iwo Jima was therefore undertaken in Feb. 1945, although it was known that the island was heavily fortified and would be vigorously defended. The operations for the capture of Iwo Jima were under the command of Admiral Spruance, who had relieved Admiral Halsey in command of the fast carrier task force of the Pacific fleet after the latter's successful sweep through the South China sea. Although the island was only 2 mi. wide and 5 mi. long, such severe fighting was anticipated that a

landing force of 60,000 United States marines, put ashore by a naval force of more than 800 ships, was provided for its capture. Iwo Jima had been intermittently attacked since June 1944 by surface ships and carrier planes, and from December onward the attacks had been intensified. Landings were scheduled for Feb. 19; as a preliminary move the carrier aircraft of Admiral Spruance's 5th fleet struck Tokyo on Feb. 16, one year to the day after the first attack on Truk. This attack was renewed on Feb. 25. Meanwhile, surface ships and planes were attacking the defenses of Iwo Jima. As soon as the marines were ashore, severe fighting developed which continued for several weeks; but on March 16 all organized resistance ceased. The airfields which were immediately developed on the island greatly facilitated the air attack upon the Japanese home islands.

To bring Japan even more closely under attack, a very large amphibious operation was directed against Okinawa, in the Ryukyu Islands, in the spring of 1945. The capture of the Marianas and Philippine Islands had brought U.S. forces within 1,300 mi. of the Japanese homeland. The capture of Iwo Jima placed them 640 mi. from Tokyo, while Okinawa offered sites for airfields within 350 mi. of Kyushu, the southernmost of the main islands of Japan. The difficulty of this assault was considerable, for Okinawa was heavily defended, and its proximity to Japan meant that any attack upon it could readily be resisted by the main strength of the Japanese air force.

After preliminary strikes by the fast carriers, and intensive naval bombardment, landings were effected on the southwest coast of Okinawa on April 1. Though there was relatively light resistance on the beaches, and the northern two-thirds of the island was occupied in a matter of three weeks, Japanese resistance in the southern portion of Okinawa, where strong defensive positions had been established, was extremely bitter and protracted. It was not until June 23 that the entire island was captured. During this long period, many naval vessels were required for the support of the troops ashore. More than 1,200 had been employed in the initial landings, and a considerable number were required for many weeks thereafter. These ships were subjected to heavy air attack by Japanese suicide planes and received considerable damage. There was relatively little danger from Japanese naval vessels in consequence of the defeat inflicted the previous October in the battle of Leyte gulf, and through April, May and June the fast carrier task force constantly operated in support of the Okinawa assault, frequently launching attacks upon Kyushu. On April 7, in a last attempt to make some use of surviving surface vessels, the great Japanese battleship "Yamato" (sister ship of "Musashi," which had been sunk in the battle of Leyte gulf) sortied, but was promptly sunk in the East China sea off Kyushu, together with the accompanying cruiser "Yahagi" and four destroyers.

With the approaching conclusion of the war in Europe, major units of the royal navy had been dispatched to the Pacific and organized as a British Pacific fleet, under the command of Adm. Sir Bruce Fraser. These ships were placed under the operational control of the commander in chief, United States fleet, and in the spring of 1945 a British carrier task force was assigned to Admiral Spruance's 5th fleet to assist in the air support of the Okinawa operation. This British force attacked Sakishima Gunto, southwest of Okinawa, from March 26 to April 20 and again from May 4 to 25 in order to neutralize Japanese air installations there.

After the conclusion of the Okinawa operation, Admiral Halsey's 3rd Fleet, the greatest assembly of sea power in

Dawn breaking over a U.S. armada moving toward Luzon in 1945, as a coast guard lookout stood at his watch

the history of naval warfare, moved northward toward Japan to conduct a preinvasion campaign aimed at the destruction of the remaining units of the Japanese navy and of industrial sites. Strikes were made against airfields and factories in the vicinity of Tokyo on July 10, and against northern Honshu and southern Hokkaido on July 14-15. On July 17, in company with units of the British Pacific fleet, 3rd fleet ships conducted the first U.S.-British bombardment of the Japanese home islands. Carrier planes attacked the Yokosuka naval base in Tokyo bay on July 18; the Inland sea area on July 24, 25 and 28; northern Honshu on Aug. 9 and 10 and Tokyo on July 30 and Aug. 13 and 15. These 3rd fleet operations were in preparation for Operation "Olympic," a vast amphibious landing projected against southern Kyushu, which was to be followed later in 1945 by Operation "Coronet," an amphibious assault into the Tokyo plain area. These last great efforts were not required, for on Aug. 14 Japan accepted the terms of the Potsdam proclamation, which involved the absolute surrender of all military forces. The cease-fire order was given on Aug. 15.

Amphibious forces were organized for the occupation,

which began on Aug. 28. On Sept. 2, on board the battleship "Missouri" in Tokyo bay, the formal surrender was signed. (W. M. W.)

VI. GENERAL CHARACTER OF THE WAR

The conclusions as to the general character of World War II and its major trends reached from as close a perspective as the end of 1946 could not be final, but even if they might be somewhat distorted because of the closeness of view, they could furnish a record of contemporary thought and serve a definite purpose. The more measured accounts of the future would have the benefit of wider knowledge and thus almost certainly a better balance of judgment. But without opportunity for comparison with the contemporary appraisals such accounts might lack some reality.

Axis Initiative.—At the outset of the war, the initiative and the power of the offensive lay completely with the axis powers. The intensity of Germany's great preparations, the confidence of success and the sense of destiny with which Hitler had imbued the reich were fully disclosed to the world as Hitler's armies plunged across the Polish frontiers.

The Germans are a persistent people, and despite the great failure of 1914-18, the short-war concept of Frederick the Great, Karl von Clausewitz and Alfred von Schlieffen again enticed them into a new effort to conquer Europe. The mistakes of the past were studied and avoided. This time there was to be no accident of the Marne to block success. So well were the preparations laid that they operated to destroy without a pause a sturdy opponent, who by World War I standards was well equipped and well trained, and, finally to wipe out all organized opposition between the Rhine and the Atlantic. The German army had been freed from the stifling hold by which old weapons and old techniques frequently had hampered armies in the past. The new reichswehr had the immense advantage of building from scratch, with no attachment to old forms and old matériel. In consequence, the German armies at the outbreak of the war possessed more fire power, greater mobility and a far heavier weight of armoured columns than any of their opponents had been able to amass in their tentative progress toward modernization.

The Polish invasion took the immediate form of a devastating air blow, followed by fast, hard-hitting armoured and infantry columns, against which the Polish army, substantial as it was, could only reel and become confused.

On paper the advantages of manpower, industry and wealth lay with the Allies; but their lack of integration spelled only destruction for Poland. Britain's strength was diffused and had to be accumulated over long water routes, and France was to prove itself utterly incapable of generating anything comparable to the German power. The Allied world was still stunned by the political-military strokes of Hitler, particularly by the nazi-soviet nonaggression pact; the small nations of western Europe, who were not without considerable political and military power, were enfeebled by the wishful thinking that their only salvation lay in taking as little action as possible to defend themselves. Hardly had Poland begun to feel the full force of the German blow, when it found its rear overrun by the Russian armies. The collapse was complete.

Even after the Polish campaign had come to an end, the western powers could offer no dynamic defense to the German threat. French and British forces began to take up positions in and outside the permanent fortifications of the continent. Behind the lines efforts were hastily made to prepare, but no mobilization or striking capacity comparable to the German power resulted. In the meantime, the German armies were regrouping, obviously for blows in the west. But while this period of the war carried over some of the aspects of the earlier peace in the way of uncoordinated defense to German aggression, there appeared certain factors which gave faint signs of Allied potentialities. The British blockade tactics began to take form. Although the central powers had greater continental resources on which to draw than in World War I, still the generally restrictive effects of the blockade were again impressed and again began to play their part. Unified British public opinion and determined leadership emerged. Signs of U.S. concern increased, and the importance of superior industrial capacity became more and more apparent.

Denmark had signed a ten-year non-aggression pact with Germany providing that "under no circumstances" would either country resort to war or any other form of violence against the other. It took just one hour's ultimatum on April 9, 1940, for Germany to destroy that pact and for King Christian to order a cease-fire. Norway, however, was a different story, and in the Norwegian campaign the pat-

tern of things to come was further unfolded. In defiance of Britain's sea power and the proximity of English naval bases, German troops had seized all but northern Norway within less than a month, and in another month all Allied forces were compelled to withdraw from the country. The unchallengeable air supremacy of the Germans in the area told the tale; and, if the lesson was a dismal one for Britain and its navy, properly interpreted it pointed also to Germany's doom, for as the emphasis on naval supremacy diminished, the significance of air power took form. In spite of an immediate and pronounced inferiority in planes, it was in Allied not German hands that the great potentialities of air power lay.

While the fighting was still progressing in Norway, Hitler launched his great attacks to the west, attacks proclaimed by him to fix Germany's destiny for a thousand years. His plans were made and his objectives were still clear. The Netherlands, Belgium and France were promptly overrun. In three short weeks the armies of four important countries were completely defeated.

Again, however, in the defeat of one of those armies lay Allied hope of the future; that army, huddled together on the beaches at Dunkirk, was significantly evacuated to England with almost no loss of life. In a few days 233,039 British and 112,546 French and Belgian soldiers were taken safely across the channel. It was Britain's surface command of the channel which accomplished it, but it was Britain's air superiority at the spot which made it possible.

The Critical Point.—It was at Dunkirk that Britain was directly threatened, and it was there that it first utilized its small but decisive air fighter superiority in its full strength. The fast and heavily armed British fighters swept clean the air above the evacuation beaches. The German bombers which had wreaked such destruction on Rotterdam and the communication lines of the Allied armies on the continent could not measurably interfere with the evacuation. And in attempting to do so, the luftwaffe, in a few days in the end of May and the beginning of June 1940, lost something in the neighbourhood of ten times as much in air personnel and planes as did its opponent.

After a respite, the air attack on the British mainland began, and again the overworked fighter command took its toll-a toll so great that though the fight was long and painful and pressed with all the determination and courage of the best German military tradition, by October of the same year the lustwaffe substantially abandoned the field. The bravery, endurance and skill of the British pilots were the main contributing factors to the result; but great credit must also go to those whose plans made available at the critical time the excellent planes which the pilots used, and particularly to those who had seen the need and designed the means by which the German planes could be detected day or night, through the use of radar. The luftwaffe had an impressive record to register; 35,000 British civilian casualties, severe damage to docks, to airdromes, to factories and to London generally, but with it all no decisive result.

As the perspective lengthens, this phase of the war stands out perhaps as deeply significant of the ultimate course of the conflict as any development which came later. Until then, Hitler had called the tune and his conquests which had matched some of the very greatest of all military history lost much of their momentum at just this point. Thereafter his complications accumulated, and he was compelled to improvise new avenues of conquest. Relying on what he assumed would be the inability and unwillingness of Britain to continue to oppose him after the collapse on the continent, Hitler apparently had made

no adequate plans for a timely or full-scale invasion of England. The luftwaffe, well conceived for bombing over the battlefield and rear areas in the field, was not adequately designed for the defeat of a nation like Great Britain. Britain stood, resolute, if shaky, and with it stood hope and the vast strategic consequences of its continuous lines of communication and bases around the world. Its stand signified the preservation of a great bastion in the Atlantic by which re-entry to the continent was possible, a great and firm base in, through and from which its own continued strength and the great powers of the North American continent could be delivered.

Including Dunkirk, the battle of Britain had cost Britain the lives of approximately 500 pilots, while the Germans had lost at the minimum 3,000 planes and most of their occupants. (The German planes were mostly bombers containing on the average from four to six occupants.)

The forces of Britain were later to be deployed in Africa and the middle east, on the continent and in the Pacific and Asia. The British victory at El Alamein, Egypt, was to give new hope to the Allied cause, but no other contribution was ever to be so critically important as was this repulse of the luftwaffe over England in the summer and fall of 1940.

Russian Fiasco.-Out of the enigma of the east evolved the next great development of the war. In 1936 Hitler had consummated the Anti-Comintern Pact uniting Germany, Japan and Italy against the U.S.S.R. In Aug. 1939 Hitler and Stalin produced a mutual nonaggression pact which had made it possible for Hitler to attack Poland and the west unhindered by any eastern involvements. And in the early morning of June 22, 1941, without prior warning or demands, the German army attacked Russia along the entire border with full strength. Precisely what motivated Hitler to attack Russia at this stage of the war remained obscure, although there were many explanations. Whatever the motive, by so doing he uncovered new forces of opposition, the extent of which he had greatly underestimated. Not only were those forces underestimated, they became a wearing burden on the German energy, which, with the growth of the military power of the United States was to crush Germany as no other great nation save Japan was crushed in modern times. The German attacks in Russia were supported by their full forces, and they accomplished the destruction of several armies in the course of their deep advance into the country. They crippled the area west of the Don without which, till then, it had been thought the soviet union could not carry on organized resistance. Yet, the Red army still fought on with matériel and personnel always at hand to continue the struggle. The failure to capture Leningrad, the repulse at Rostov and Moscow, showed Germany that there were great centres of Russian resistance still to be taken and, more clearly, that the soviet armies were yet to be annihilated. The early severe winter, the lateness of the German attack, German tactical mistakes and the means of trading space for time accumulated to account in large part for the effectiveness of the Russian resistance in the face of terrible losses. Without, however, the persisting will of the people of the soviet union to endure and conquer their enemy, all of the foregoing would have been unproductive; in the final analysis it was that will which inspired all the vast effort which led to victory.

An offensive through 1942 which took German forces 1,000 mi. into the heart of Russia over a front of even greater length, severely taxed the strength of both Russia and Germany. In terms of both extent and numbers of troops engaged, the energies expended in this tremendous

campaign were far greater than the land campaigns in the west. There were no wide general withdrawals to entice the wehrmacht over a "scorched earth" to eventual destruction. It was hard continuous fighting all the way.

That the Red army was capable of conducting this fighting retreat and then of extricating itself to undertake first a winter and then a summer offensive of the magnitude of those of 1942 and 1943, bespoke a nation of first rank, strength and unity. It is true that the African and Italian invasions effected a most helpful diversion of German strength. It is also true that large shipments of motor vehicles from British and U.S. sources played an important part in enabling the Red army to forestall the enemy, but its own vast sacrifices and real military skill were the fundamental factors of the soviet union's strength. With the German failure to take Stalingrad, the Verdun of the east, Hitler's dream of the Ukraine and the Caucasus was shattered; but more than this was involved. With this great block thrown in the German path, the impossibility of a complete subjugation of the country came in sight, for thereafter Germany was never again to possess the capacity for great strategic offensives, or, indeed, decisive defensives, in either the east or the west. With the final Anglo-U.S. and Russian offensives in the spring of 1945, it was Germany's turn to reel and become confused.

Hitler had plunged Germany into the Russian venture confident of results comparable to the French collapse. These failed to materialize, and the growing power of the west left him with a two-front war—the eternal phobia of German military thinking since Bismarck—a two-front war of a magnitude and scope which even Hitler's own general staff had never envisaged.

United States Underrated.—The importance of the United States as a military power had not been taken fully into account even after the decisive role played by it in World War I. Its full emergence as a recognized military power of vast potentiality did not occur until World War II.

In the period between the two world wars, its nonaggressionism, unpreparedness and uncertain foreign policy had diluted its effectiveness as a factor in the prevention of war. Its new role under the leadership of President Roosevelt did not come about readily. In the fall of 1940, for the first time in history, the United States adopted compulsory military service as a peacetime measure. This was the first expression of its power. The second came in the form of the so-called Lend-Lease legislation, whereby countries whose defense was deemed important or vital to the defense of the United States were supplied with arms, munitions of war and other supplies on a basis which meant almost unlimited aid to those fighting the axis. The legislation was enacted in March 1941, and it is difficult to overstate the enormous influence it had on the course of the war.

The United States had been concerned over the plight of Poland but thought of war on such an issue was largely excluded from the public mind. With Britain beleaguered, however, a deep uneasiness pervaded the country, which gradually became sensitive to its own danger. This sense of danger was paralleled by a general abhorrence of nazi methods. Though late in the day, the tremendous energies of the country began to be applied to the objective of Hitler's defeat. President Roosevelt was a strong leader, and in his now fully aroused internationalism and antagonism to Germany he led the nation in its new role. The United States was to become the "arsenal of democracy."

Not only were the goods to be made available to the antiaxis belligerents; they were to be delivered. The Atlantic charter was compounded in the summer of 1941 by Roosevelt and Churchill as the pattern for "a better future for the world."

The final spur to the full expression of U.S. energies came, however, only with the surprise Japanese attack at Pearl Harbor on the morning of Dec. 7, 1941. Though matters had been clearly heading for a crisis of some sort, the country was stunned by the news that Japan had deliberately and without warning attacked the United States. Thenceforward without stint the country formed its armies, navies and air forces, forged its weapons and greatly multiplied its already vast general production facilities.

The full effect of this effort on the outcome of the war was difficult to measure. That it was the greatest single factor in the winning of the war for the Allies there can be no doubt. Britain continued to perform its full and potent share, but it did not possess the population and the resources to conclude the battle decisively. The soviet union, for all its rugged power, did not possess the capacity to effect a complete defeat of Germany. The victory was obviously the result of the combined effort of all the powers including resistance forces, but it is a fact that where both Britain and Russia produced matériel and manpower in vast quantities, the United States produced far more than both combined in the way of most munitions of war, including planes, motor vehicles and ships. At the same time the country had 14,000,000 men under arms in its own military services. With its first-line navy wiped out at Pearl Harbor, it ended the war with a balanced fleet incomparably the largest in the world. Its men fought in every corner of the world, and while it furnished the weight of men and materials to bring about the final victory in western Europe, it almost singlehanded defeated the forces of the Japanese empire utterly in the Pacific. Its airplanes soon were flying in greater quantities over Germany than those of Great Britain, and many of those flown by Britain were either U.S.-built or U.S.-equipped. Much of the equipment of the British armies was U.S.-made, and almost all of the new equipment of the French army was of U.S. manufacture. The Chinese armies were largely maintained by U.S. supplies, and besides thousands of aircraft and great shipments of raw materials the Red army was made mobile in a modern sense by the constant stream of locomotives, rails, rolling stock and approximately 300,000 U.S. motor vehicles to the soviet union. Deprived of normal imports and trade, the very economy of Britain during the war was substantially supported by U.S. materials and foodstuffs.

In all, more than \$40,000,000,000 of U.S. equipment and supplies were sent abroad to the Allies during the course of the war. Of the military items alone, which together constituted less than half the entire shipments, some concept of the extent of United States contribution can be obtained from the fact that the equivalent in United States cost of 588 armoured divisions or 2,000 infantry divisions were dispatched and delivered to U.S. allies in addition to the munitions shipped abroad for the use of the United States forces.

Lest it be thought that this contribution was rendered more in terms of weight of manpower and matériel than military skill, it is necessary to record that the armies and navies of the United States were led by men whose genius for military and naval accomplishments were certainly not excelled by the leaders of any of the Allied or axis powers. Gen. George Marshall's strength of character,

vision and administrative ability, Gen. Dwight D. Eisenhower's genius for combined command and Gen. Douglas MacArthur's brilliance in the Pacific campaigns left no doubt as to the strength and skill with which the armies were led. Adm. Ernest J. King's strategic and tactical direction of the U.S. fleets and Adm. Chester W. Nimitz's operation of them—their application of carrier air power and their mastery of amphibious attacks under many complicated situations—testified to the effective employment of U.S. sea power. New concepts and tactics on the use of air power, largely the result of Gen. H. H. Arnold's driving inspiration, became a most important element in the U.S. contribution.

Much as Germany had overrun vast areas in western Europe and Russia, so Japan had conquered by brilliant tactics a vast area on the mainland of Asia, the Malay peninsula and the Pacific Islands. Japan's incursions in China had dated from 1931 and continued intermittently until 1940, when Japan turned south to prepare its jumping-off bases for its coming attacks on the Dutch and British possessions in the Pacific. Like Germany, Japan felt that its hope lay in a quick and decisive victory, preferably to be achieved when its chief opponents were concerned elsewhere. With timing suited to the occasion, when Britain and the U.S.S.R. were fully engaged in Europe, and with the United States sleeping late of a Sunday morning, Japan struck out in many directions at once in the hope of achieving a decisive result. By Aug. 1942 Japan controlled a new area which in geographical extent and numbers of people subjugated rivalled the conquests of Germany. Japan accomplished this largely through its control of the sea and air throughout the area, and it was able to achieve it at very little cost in lives. In doing so, however, it strained its own capacities and stirred to vigorous action the United States, whose industrial capacity exceeded Japan's at least tenfold. By a combination of sea and air power, and a development of amphibious tactics on a scale which dwarfed the same type of Japanese operations, the Japanese were driven completely on the defensive in less than two years' time. As an example of what great flexibility was attained through U.S. superiority on the sea and in the air it is significant to note that at the time of the surrender, the Japanese still had an army of about 5,000,000 men under arms. They had been able to deploy only between 600,000 and 700,000 of these against their principal enemy in the Pacific, and the United States forces at no time were called upon to fight more than 300,000 of them. Mainly through control of the air and sea, the United States forces in the Pacific were able to defeat those they met in the field (most of whom were killed), and they could largely choose where and when their battles were to be fought. It required many men, long lines of communication, vast wealth and skilful leadership to accomplish this, but in the long and interesting study of the importance of logistics in warfare, this is one of the most interesting case studies to be found in military history.

Combined War Policy.—Another outstanding feature of the war which determined the course of most of its campaigns was the prompt and effective manner in which the energies of the Allied Powers were combined to achieve their objectives, once the United States had become engaged.

Whereas the period between the wars was marked by the dearth of effective collective action, the importance of close integration of Allied war policy, particularly Anglo-U.S., was quickly recognized and acted upon once all were engaged. The early meetings of Churchill and Roosevelt,

followed later by meetings at which these two were joined by Stalin and Chiang Kai-shek, resulted in strong coordinated action. This co-ordination greatly expedited victory and reduced misunderstandings. It served to convert the necessarily defensive attitudes which German and Japanese aggression had initially forced on the Allied Powers into a mighty 'round-the-world offensive which finally overwhelmed all of the axis powers completely.

During and immediately after the war, a number of differences of view between the United States and Great Britain were disclosed and commented upon. More disclosures of this nature would no doubt be made and exploited as time went on. But the fact remained that during the war these divergences of view were ironed out, controlled and finally merged into a close association of the leaders of the states and their military staffs in the conduct of the war. In the meetings of the chiefs of state, their individually firm adherence to the principle of combined action, particularly in the case of President Roosevelt and Prime Minister Churchill, and in their frequent interchanges, lay the key to this integration. The integration was carried out by means of the almost continuous sessions of the combined chiefs of staff. (See Chiefs of STAFF, COMBINED AND JOINT.)

Of the number of important decisions taken in this combined form, perhaps the greatest, apart from the underlying determination to pool and administer Anglo-U.S. resources on a combined basis, was the determination to treat the European theatre as the primary theatre, and the defeat of Germany and its armies as the primary objective.

This plan was first proposed at the Anglo-U.S. staff talks in Feb. and March 1941 and was approved in the talks at the Atlantic conference that summer. When Churchill and the British staff arrived in Washington after Pearl Harbor, there was considerable doubt as to whether the U.S. point of view had changed as a result of the Japanese attack. They were surprised and relieved by the immediate assurance that Pearl Harbor had not altered matters, and that no alteration in the grand strategy was proposed.

So vast were U.S. resources that a wise use of the forces available made it possible to establish a sound temporary defense in the Pacific and at the same time commence the development of immense offensive power in that area. The decision to throw the greatest strength against Germany ensured the decisive character of the victory in the European theatre and never seriously prejudiced the operations in the Pacific. Continuous Russian pressure combined with the effects of this decision to keep Germany's strategy invariably out of balance. Germany was capable of serious threats such as the submarine and the V-1 and V-2 attacks, but it never could give sufficient time and resources to develop any threat into an effective means of averting defeat.

The second most important decision taken by the combined chiefs of staff was to invade the European continent from the west. Once made, it was carried out effectively by all the elements on whose co-operation it was to depend.

Lack of Axis Integration.—In contrast to the unity of purpose and action thus carried out by the Allied Powers was the almost totally unrelated activities of the axis powers. There is no evidence that any close integration of strategy and policy existed between Germany and Japan, and surprisingly little between Germany and Italy. Japan's attack on Pearl Harbor was known to Germany but seems not to have been integrated with German plans. Italy quickly became a burden rather than an aid to Germany,

and Italy's unilateral actions in Greece and Africa substantially complicated Germany's strategic problems.

Even within Germany itself there appears to have been only a limited strategic concept. Hitler had in mind Germanic domination of Europe and pursued a policy of successful opportunism in respect of the Rhineland, Austria and Czechoslovakia. By his successes in these areas he beguiled the nation into deeper waters. His initial conquests were highly co-ordinated affairs, with the wehrmacht operating in accordance with familiar German tradition, but once these were accomplished Hitler's much vaunted will outran Germany's military capacities and even its plans. By the end of 1946, no German strategic plan encompassing the war as a whole had been disclosed. It is doubtful it one existed, for the evidence indicated that Hitler's personal desires rather than seasoned judgment determined the course of the war for Germany. Not since Napoleon had there been combined in one person such a dictatorship of the state and its military force, and rarely had any individual leader exacted such ultimate defeat of his country as Hitler demanded of Germany. Indeed, the final battles surged up to the very porticos of his office in Berlin.

Whereas there was an orderly development of Allied strategy, Hitler's grand intuitions and concepts culminated as the tide ran against him into a bankruptcy of military and political policy, and at the end it was merely his perversity which governed.

Development of Air Power.—The enormous development of air power in World War II and the new strategical concepts it provoked deeply affected the entire course of the war.

World War II mobilized greater forces in all categories than had ever been amassed before, but the increase in strength in air and naval forces was particularly marked. This was the first war in which aircraft on decisive missions ranged far at sea and operated over many hundreds of miles. The new strategic and political consequences of air power fell far short of eliminating the profound influence of sea power upon the outcome, but the predominant position which sea power had formerly played in warfare was greatly affected by the developments in the air arm.

In the spring of 1940, the Germans, largely through air power, accomplished the successful invasion and occupation of Norway. This was followed in the spring of 1941 by the seizure and occupation of the island of Crete, again, largely through the concentration of air-borne troops. Norway and Crete were each situated in sea zones whose control since Lord Nelson's day were considered indisputably British. Yet each, largely by reason of German plane superiority in the area, was quickly wrested from Britain's domination. The sinking of the "Prince of Wales" and the "Repulse" off the Malay coast in Dec. 1941 (not to mention Pearl Harbor) and the British attacks on the Italian navy at Sardinia, Taranto and Naples by Adm. Sir Andrew B. Cunningham's somewhat antiquated torpedo planes furnished further impressive evidence of the vulnerability of ships to air attack.

The early German attacks on Poland and Britain were the first manifestation of strategic bombing forces in operation. But the supreme manifestation of modern air power came with the British and U.S. long-range bombing over Germany. From the spring of 1942 to the summer of 1944 the operation of these bombers made it possible to carry on a powerful offensive against what otherwise would have been an unreachable enemy. This bombing caused terrible destruction and inflicted during the war a little

more than 1,000,000 civilian casualties, 5,000,000 evacuations and severe privations to many millions of others. Industries, railroads, oil refineries and storages and industrial cities generally felt the weight of these attacks. In times of emergency the great bombing squadrons were diverted to deal with targets which directly supported Germany's offensive operations, such as the submarine warfare and subsequently its missile warfare. Indeed, on occasions the strategic forces were even thrown against German tactical forces in the field. In the course of destroying German ground targets through their own fire power and their accompanying fighters, these great bombers played a large part in wearing out the German air forces.

By 1943 Great Britain had become an enormous air base from which many thousands of U.S. and British bombing planes were operated. Until the end of the war these concentrations constituted the greatest demonstration of modern air power the world had ever seen. It took months of effort and heavy casualties to achieve it, and the demonstration could never have been made without the control of the seas. The result, however, was to carry home to Germany an offensive which sea power alone could not accomplish. It was primarily through air power that the full impact of modern war with all its horror and suffering was brought home to the German people.

In the Mediterranean, the employment of long-range as well as tactical planes permitted landings to be made and held which but for the use of such air power might have had disastrous results: The landings in Africa, Sicily and at Salerno and Anzio were all hazardous affairs, and in each case Allied air superiority greatly helped to maintain the foothold. And, finally, the great Normandy invasion of 1944 was, as General Eisenhower testified, made possible through the use of Allied air power. There were other elements which contributed to the success of that invasion, without some of which it could not have been successful, but air power furnished the determining factor that made the conquest of the continent by the ground forces feasible.

In combination with naval power the use of air weapons also contributed much to end what was perhaps Germany's greatest threat, namely, its U-boat warfare, and in combination with the ground forces air power greatly assisted the progress of troops over the ground.

In eastern Europe the Russian armies were heavily supported by medium-range bombers and tactical planes. Soviet air power, however, had been created primarily to assist the infantry over the ground, and though most effective for the role it was designed to play, it never reached the power or flexibility which the air forces of the western powers were able to bring to bear.

On the other side of the globe as air bases became available, particularly in the Marianas, the bombing of Japan rivalled the attacks on Germany. A new type of very longrange bomber of large bomb capacity was placed in operation, and toward the end of the war, with these bombers supplemented by air strikes from carrier-based planes, the air offensive on the Japanese mainland became intense. It laid waste large sections of 66 of the more important cities of Japan. Finally, it was from two of these long-range bombers that the atom bombs were dropped on Hiroshima and Nagasaki.

In stressing the development of air power, it is necessary in order to measure the development to draw comparisons with the sea and ground forces. But while the growth of

air power in World War II was great and deeply significant, it is important to record that the victory was not achieved and could not have been achieved without the coordination of all arms. Though control of the air was vital to almost every operation of the war, it was still necessary to transport the energies of Britain and the United States by means of ships to the point where those energies could be made effective. Ships had to be maintained and seaways kept open throughout the world for the greatest transportation of men, food and munitions ever undertaken in the history of warfare. While this transport was being accomplished, the Allied navies met and effectively dealt with all axis sea-borne objectives, including the serious threat of the U-boat. They greatly assisted in the establishment of landing forces ashore through highly skilful amphibious tactics and shore bombardment. Moreover, with complete control of the air and complete control of the seas, the final objectives in World War II had to be taken as in all previous wars by men moving over the ground. (J. J. McC)

VII. CONCLUSIONS

The full cost of World War II will never be known, either in intrinsic values or in intangibles. Even the best estimates will continue to be guesses. At the end of 1946, a discussion of the political, economic and psychological impact of the war on different nations and on the world as a whole had to be recognized as a matter primarily of surmise based on the trends which had thus far developed.

The costs of war could not be measured alone in such mathematical terms as battle casualties, dollar expenditures and similar data. Such figures were but partial and inadequate yardsticks. The data regarding casualties among civilians were only partially available. They were known to be very great, often exceeding the military losses. The loss of life because of the privations, cruel treatment and mass murders which were a feature of the axis concentration camps had to be included in any comprehensive record of costs in terms of human lives. A more difficult problem was to appraise the losses occasioned by the displacement and dislocation of populations. Recognition had to be given to the long-term effects of devoting the major portion of the world's over-all capabilities for a period of years to the objective of destruction.

Costs, computed in terms of dollars, of raising and supporting armed forces, lost their significance as the conflicts of war extended from high in the air to the depths of the oceans and over most of the earth's surface. The destruction of homes, industries and means of livelihood of millions of people probably represented a greater monetary cost factor than the support of armed forces. The destruction common to World War II could not be measured in terms of the replacement cost alone.

The figures in the succeeding paragraphs must be considered in light of the foregoing factors.

Fifty-seven nations, Allied and axis, were belligerents in World War II. In the final compilation of figures as to casualties and expenditures of resources, the data for each nation should be viewed in the light of that nation's total manpower and national wealth. The major portion of the cost was borne by the United States, the British commonwealth, the Union of Soviet Socialist Republics, China and France and by the three major axis powers, Germany, Italy and Japan. The battle dead gave a partial picture of that cost.

The cost of victory for the United States in battle deaths and missing personnel was 295,904 lives, or 1 in every 500 of the 1940 population.

The cost to the British commonwealth in military personnel killed and missing during the period Sept. 3, 1939, to V-J day was 452,570. This represented 0.08% of the population of the British commonwealth. These casualties came from all parts of the empire, but the majority were suffered by the people of the home islands. The figures for those killed and missing were approximately 305,770 from the United Kingdom itself, or 1 in every 150 of the population; 39,300 from Canada, 29,400 from Australia, 12,200 from New Zealand, 8,700 from South Africa, 36,100 from India and 21,100 from the remainder of the empire.

The Union of Soviet Socialist Republics reported its losses as approximately 7,500,000 military personnel killed and missing, or 1 in every 22 of its 1940 population.

France had 200,000 military personnel killed and missing, or 1 in every 200 of its 1940 population.

Germany lost 2,850,000 military personnel killed and missing, or 1 in every 25 of its 1940 population.

Italy had 300,000 military personnel killed and missing, or 1 in every 150 of its 1940 population.

During the course of the war, China suffered the second largest number of casualties of any of the Allied nations. Its battle losses numbered 2,200,000 or 1 in every 200 of its 1940 population, excluding Manchuria. These figures covered the period during which time China was formally at war with Japan and did not include the six years of undeclared hostilities beginning in 1931.

Signing of the Japanese surrender document aboard the U.S.S.
"Missouri" in Tokyo bay, Sept. 2, 1945. Gen. Douglas MacArthur is
shown broadcasting the ceremonies as Japanese Foreign Minister
Mamoru Shigemitsu signed for the emperor

As a result of its aggression, Japan had lost 1,506,000 military personnel killed and missing since 1937, or 1 in every 46 of the 1940 population of its home islands.

The total number of military personnel of the major Allied powers killed and missing during World War II was about 10,650,000. The total number of military personnel of the major axis powers killed and missing during the war was approximately 4,650,000. The total cost to the principal belligerents, both Allied and axis, in military personnel killed and missing in battle exceeded 15,000,000

The very considerable costs to the smaller countries, particularly Poland and the nations in southeastern Europe, added hundreds of thousands more to the total.

As a result of the nazi method of obtaining slave labour during World War II and the battles which were fought over so much of the European continent, on V-E day approximately 10,000,000 civilians were displaced beyond the national boundaries of their own country by reason of war. Approximately 6,000,000 of these displaced persons had been returned to their homes at the end of 1946 by the occupying powers, plus the numbers handled within the soviet zone, on which no figures were available. As of the end of 1946, approximately 1,200,000 persons were still being cared for by the three western Allies in Germany.

In the lar east, approximately 5,000,000 Japanese, about half civilians, had been returned to Japan from Asia and

the Pacific Islands. Approximately 1,000,000 Koreans had been returned to Korea. At the end of 1946, about 1,500,000 Japanese remained on the continent, and about 500,000 Koreans were still in Japan.

One military lesson to be drawn from the war indicated that, if war came again, crippling and perhaps decisive blows might be struck in the opening moves. The English channel was now not much more of an obstacle to destructive fire power than the Rhine would have been in World War I. The seas and polar wastes guarding North America would, in a few years, be not much more of an obstacle to the destructive weapons of the future than was the English channel in bygone years.

Of great importance to a nation's security in the future was the shrinkage in the time conceivably available to mobilize for defense. Mass destruction weapons, when considered together with available and potential means of delivery, made it evident that if war came, there would not be time for a nation on the defensive initially to mobilize on the basis of World War II schedules, as did the United States in 1940, 1941 and 1942. The great nations of the world had the choice between the constant maintenance of a high state of readiness in industry and military forces, or, alternately, the evolution of some international arrangement which would give mutual assurance against aggression.

World War II, both in the operations and in the weapons developed, demonstrated that, with the exception of the wealthy powers, a nation could no longer depend on its armed forces alone for security against external aggression. The Netherlands, Norway, even Poland, fell in a matter of a few days. Modern methods of war required large populations, large national areas and great industrial capacity not only to support these methods, but to sustain the impact when attacked. Hence, the majority of the nations in the world had to depend primarily on international action for their security. Even if all other elements were available to them, they would not possess the wealth to support the costly modern weapons and forces. A growing recognition of this situation might result in a decreasing emphasis on armed forces and installations except for those necessary to internal security and for the support of agreements for collective security.

Turning to the political results of World War II—for political objectives are the basic objectives of every war—the outcome was still far from clear at the end of 1946. The world was left with two great political forces: soviet communism and western democracy in its various forms. Although the stated purposes of these two political systems might be approximately the same, their concepts were difficult to reconcile in practice. Some system of international collaboration was essential if another war were to be avoided. Perhaps a solution lay in some sort of world commonwealth. It appeared, however, that the alternative could only be continuation of the struggles for ascendancy or survival.

Pending the proven development of some sort of world order, the world had to deal with a drastic shift in the world power situation. Germany, which at the beginning of the decade was a great power, had been eliminated from that category. France, which was recognized as a great power in the 1930s, one of the victorious allies of 1918, was now weaker than before the war. Italy, a cobelligerent at the end of the war, was definitely a minor power. Thus, the four great powers on the European continent in 1937 had in ten years been reduced to one—soviet Russia.

The destruction of Germany and the impact of the war on other European countries left a weak western Europe overshadowed by the military power of the U.S.S.R. The sovict union emerged as one of the two greatest world powers, although with temporary weaknesses to overcome resulting from its enormous expenditures and losses during the war. All Europe suffered from the economic ills of dislocation and scarcity and from the artificial barrier separating eastern and western Europe as established by the occupation forces. Stability could not be achieved until Europe's economic problems were solved and until military power ceased to be the dominant factor in political considerations.

Great Britain had been weakened, not only directly by the cost of the war but also relatively by the shifts in the power potential of other nations and the impact of the war on the controls through which it had long made its influence felt throughout the world. The British empire was in a process of evolution. Witness the grant of selfgovernment to India and the formula being worked out mutually with the Egyptian government. It remained to be seen whether in the long run the evolution of the British empire might develop into a loosely knit federation of states which in turn might point the way to a practicable solution for the remainder of the world. Pending the development of such a world solution, Great Britain would continue to be gravely preoccupied with Europe, since its vulnerability to modern weapons was all too apparent. Equally the portions of the British commonwealth, such as Canada and Australia, without loosening their commonwealth ties, appeared to be faced with the necessity of undertaking independent action in order to look after their own interests.

World War II gave a great impetus to the awakening of backward and colonial peoples, and the generation of a feeling of nationalism and some cohesion in such peoples. This was true in the far east and in the middle east and even in Africa. In the long run the development of this situation should make for a more stable world, providing an over-all solution to the problem of security as between the great powers could be found. For the immediate future, this lively force further complicated the already chaotic world political scene.

The war left the middle eastern area as one of the most troubled areas of the world. It was shadowed by the military power of the U.S.S.R. The new influences had lessened British power in the area.

At the beginning of the decade in the far east, Russia and Japan were recognized as the great powers. The war eliminated Japan, at least for the time being, and brought China forward as a power to be reckoned with. China was weak and split by internal strife. Also it had made important treaty concessions to the U.S.S.R. The future structure in the far east would depend in great part on whether China could fill the void created by the elimination of Japan as a military power.

It was U.S. industrial and military power which provided the additional strength necessary to stem the high tide of initial axis successes and finally to bring the war to a victorious conclusion. The direct military cost to the U.S. for the mobilization of more than 12,000,000 men and the supply of war matériel to its allies was approximately \$350,000,000,000 between 1939 and 1946. It required three to five years for the United States to bring the various components of its power actually to bear against the axis. It was U.S. industry which was called to the colours to equip and support not only U.S. forces, but considerable portions of allied forces, and earned the title of "the arsenal of

democracy" But all this required time, since the total mobilization of a nation s force is dependent on mobilization of its industry.

An important economic result of World War II was the tremendous expenditure of resources, either through destruction or through absorption in the manufacture of implements of war. Some resources such as timber might be replenished in time, but other resources such as minerals and oil were gone for good

The majority of the nations which were damaged as a result of military action were in the throes of rehabilitation and of meeting the necessity of establishing adequate living standards for their peoples. This was particularly difficult for the defeated axis powers, now heavily dependent on the Allies for many of the essentials of life. Until such time as these nations could provide for their share of the economic load, the stability of the world would continue uncertain.

During the struggle there was developed to a high de gree of efficiency a form of psychological warfare, or the war of nerves. Extensive use was made of propaganda in all its forms, both during the war and after cessation of hostilities. This war of words had an unhappy after effect seriously complicating and retarding the negotiations concerning the terms for peace settlements. This comparatively new phase of diplomacy would continue to influence the political relations of the world powers through the moulding of public opinion along predetermined lines. This procedure could develop into an evil force of serious moment in international affairs. A free press remained the best defense against this danger.

Emerging from the most widespread and most disruptive war in history, the world faced many major political economic and social problems of great importance to the peace and well being of humanity. The growth of national ism and the desire of backward peoples to improve their political position and their standard of living was a factor which presented varied problems throughout the world. The tremendous advancement in communication facilities during the decade, greatly accelerated by the demands of military necessity, had brought all peoples close together in their human relationships. Technological progress had leaped forward under the pressure of war. It was a sobering thought that world political and moral developments had lagged behind technological developments.

A definite concept for the establishment of international peace had been outlined in the charter of the United Nations. This concept recognized the power of the great nations and the sovereign rights of the small. If it could survive the clash of ideologies, it gave promise of leading the world to a peaceful solution for many of its problems and, finally, to a world without war. (G. C. ML.)

Wrestling

The state of Oklahoma in general, and Oklahoma Agricultural & Mechanical college, Stillwater, Okla., in particular dominated amateur wrestling from 1937 to 1946. Of the 17 national championships staged over the 10year period, Oklahoma representatives won 11 of them. Oklahoma A. & M. captured each of the seven national intercollegiate championships held during the span.

Only eastern wrestlers broke into the team dominance of Oklahoma in the Amateur Athletic Union championships. The West Side Young Men's Christian Association annexed three titles; the New York Athletic club two, and the Baltimore Y.M.C.A. the other in A.A.U. competition.

Dean of amateur wrestling was Coach Ed Gallagher who guided his Oklahoma Aggies to eight national inter collegiate championships before he died in 1943 One of Gallagher's pupils, Art Griffith, carried on with a team victory in 1946, the year the intercollegiate meet was re sumed after a three year recess because of the war

Weight divisions in wrestling changed frequently the most noteworthy changes being increases from 112 to 115 lb, 118 to 123 lb and 158 to 160 lb

Southwestern State Teachers college of Weatherford Okla, narrowly overcame the Buffalo Y M C A 111½ to 11 in the 1937 A A U tournament The meet marked the first national championship for the state of Utah when Merrill Croft won the 118 lb division Willard Duffy of the University of Indiana Bloomington Ind, was judged the tourney's outstanding wrestler

Led by Joe McDaniels a 123 lb winner in both tournaments, Oklahoma A & M scored the only double of the 10 year period by winning both the national A 4 U and intercollegiate titles in 1938. The Aggies repeated in 1938 in the intercollegiates, but the New York A C made good a 5 000 mi journey to San Francisco, Calif, to win the A A U championships

Henry Wittenberg led the West Side YMCA of New York city to successive AAU team titles in 1940 and 1941 and started a string of five individual championships in doing it Wittenberg won the 175 lb divisions in 1941 and 1942, and repeated as 191-lb champion in 1943, 1944 and 1946

Oklahoma A & M collegians made a landslide of 1942 wrestling easily winning the college phase of national championships and competing for the Crescent club of Tulsa Okla, to win the AAU crown Dave Arndt 145 lb and Vernon Logan 155 lb, won titles in both meets Collegiate competition also marked repeat titles for the University of Michigan's (Ann Arbor Mich) brother team of Merle and Burl Jennings in the 121- and 128 lb divisions, respectively

The east dominated AAU championships in 1943 and 1944, the West Side YMCA of New York city taking the 1943 title and Baltimore 'Y" wrestlers winning in 1944 Midshipman Malcolm McDonald, in the 121 lb class be came the first wrestler from the US Naval academy to win a National AAU mat title, and also was judged the out standing wrestler of the 1944 tournament

A A U. championships in 1945 and 1946 featured a series of repeat championships, topped by Wittenberg's fifth national crown as titlist of the 191 lb division in 1946 Three triple champions were crowned in the 1945 national A A U—Dr A M Northrup of San Francisco, Calif, 175 lb, Richard Vaughan of Lancaster, Pa, heavy weight, and Douglas Lee of Baltimore, 155 lb Lee, who won his first A A U title as a 135 pounder in 1941, high lighted the 1946 tournament by defeating Dr Northrup in the 175 lb final The Oklahoma City Y M C A captured the 1945 team title, while the New York A C won in 1946

Professional Wrestling.—The paid to wrestle fraternity fared poorly during the ten year period Claimants of

world titles in 1938 included Jim Londos Strangler Lewis, Doc Len Hall Bronko Nagurski Jack Sherry and Hans Stenke Most of them had retired by 1946, at which time the former heaviweight boxing champion of the world Primo Carnera had become the chief pro mat at traction (MPW)

Wyoming

A Rocky mountain state Wyoming was admitted to the union on July 10 1890 as the 44th state Leadership in the extension of rights to women gave it the name 'Equality state' Land area 97 506 sq mi water area, 408 sq mi Population (1940) 250 742 including 157,165 rural and 98 577 urban 229 818 native white 950 Negro 17 107 foreign born and 2 345 Indians On July 1, 1944, the bureau of census estimated the population of the state at 257 108 Capital Chevenne (1940 22 474) Other cities of 10 000 or more Caspar (17 964), Laramie (10,627) Sheridan (10 529)

Elective state officials in 1937–38 were governor Leslie A Miller secretary of state Lester C Hunt auditor William Jack treasurer, J Kirk Baldwin and superintendent of public instruction, Jack R Gage. In the election of Nov 1938 the following state officers were chosen governor, Nels H Smith (Rep.), secretary of state, Lester C Hunt (Dem.) auditor, William Jack (Dem.) treasurer, Mart T Christensen (Rep.) and superintendent of public instruction. Esther Anderson (Rep.) The Republican party was given the balance of power on administrative boards and a majority in both houses of the 1939 legislature.

The 1939 session of the state legislature combined the state planning board with the state conservation board and gave the new board power to make surveys of water trans portation needs, recreational facilities soil adaptability of various parts of the state for crops range and recreation mineral resources, possible improvement of the public service and fish and game. Attempts to remove the sales tax on foods and to require the use of coal instead of gas in public buildings failed in the legislature.

In the general election of Nov 1940, the Republicans retained control of the state senate but were forced to take a position of equality in the state house of representatives since 28 Demociats and 28 Republicans were returned. The state voted Democratic in the national election giving President F D Rooscyelt 59 287 votes. Wendell L Willkie 52 633 Roger Babson 172 Norman Thomas 148 Sen J C O Mahoney was reflected to the US senate with the largest majority ever given a Wyoming candidate—more than 19 000—despite the fact that his Republican opponent, Milward Simpson carried on one of the most active cam paigns in the state's history. In the congressional election John J McIntyre (Dem.) defeated Representative Frank Horton (Rep.) Many celebrations were held in July 1940 in honour of Wyoming's 50th year of statehood.

The state legislature enacted few laws in 1941 A teachers' retirement act was passed but was vetoed Communists were barred from primary and general election ballots. Defeated were attempts to replace the 2% sales tax with a gross receipts tax to establish a drivers' licence law to legalize gambling, to move the college of agricul ture and to remove regulations on trucking. Ninety per cent of the more than 300 bills introduced in both houses were designed to correct defects in existing laws

Principal state officers elected in Nov. 1942 were: governor, Lester C. Hunt (Dem.); secretary of state, Mart T. Chistensen (Rep.); auditor, William Jack (Dem.); treasurer, Earl Wright (Rep.); superintendent of public instruction, Esther Anderson (Rep.). There was no meeting of the state legislature in 1942.

In the general election of 1942, 30,771 Republican and 23.684 Democratic votes were cast.

Mart T. Christensen (Rep.), secretary of state, died on Oct. 12, 1944, and William Jack (Dem.), state auditor, was appointed secretary of state by the governor on Oct. 16, to finish Christensen's term, a little more than two years. On Oct. 17 the governor appointed Carl Robinson (Dem.) as state auditor to finish William Jack's term. In the general elections of 1944, 51,921 Republican (Thomas E. Dewey) and 49.419 Democratic (Roosevelt) votes were cast. Ralph Kimball (Rep.), supreme court justice, and Frank Barrett (Rep.), congressman, were re-elected.

State officials elected in Nov. 1946 were: governor, Lester C. Hunt, second term (D.); secretary of state, Dr. A. G. Crane (R.); auditor, Everett T. Copenhaver (R.); treasurer, C. J. Rogers (R.); superintendent of public instruction, Edna B. Stolt (R.). Fred H. Blume was reelected associate justice of the supreme court. A Republican legislature was elected. (A. T. L.; M. H. E.; X.)

Table VII -- Mineral Production

X-Ray

The 50th anniversary of the discovery of the X-ray was celebrated throughout the world in 1945. On Nov. 8, 1895, Wilhelm Konrad Roentgen at the University of Würzburg discovered the new form of energy which he called "X-rays."

The atomic bomb had served to recall in a dramatic way the effect which the discovery of X-rays had upon knowledge of the structure of the physical universe. Arthur H. Compton recalled how Professor Albert Michelson, when dedicating the Ryerson Physical Research laboratory at the University of Chicago, Chicago, Ill., in 1893, had stated that the fundamental principles of physics were then well established and that it remained only to make more precise measurements of the known physical constants. As Dr. Compton observed in his article, "Modern Physics and the Discovery of the X-Rays" in the Nov. 1945 issue of Radiology, we were living up to that time in a "determined world, precisely predictable according to laws that were clearly known." It was a world neatly arranged in known patterns, made up of a certain number of elements, each of which in turn was composed of a certain number of atoms. Roentgen's discovery fell into that neatly arranged world with an effect upon the physical theories of the day comparable to the effect of the explosion of the atomic bomb upon the social and political life of a half century later. Soon we were living, not in a world of inert elements, but of electrons, protons and neutrons. The world which had been fixed and determined became a world in flux, seething with constant change in its ultimate structure. The continuing effects of this revolutionary discovery were disclosed as the results of the explosion of atomic bombs were published and as scientists explored the far-reaching nonmilitary possibilities of atomic fission.

The effects of the use of X-rays in medicine had been almost, if not quite, as dramatic and important as their effects on physical science. The decade which ended in 1946 witnessed inventions and discoveries which constituted important advances in the field of medical radiology.

New Apparatus.—From the earliest days of the use of the X-rays in medicine attempts were made to construct an X-ray tube with a rotating anode but it was not until about 1937 that a practical rotating anode tube was devised. Important improvements were made in the tube during the next ten years so that ir became standard equipment. It made possible a rapidity of exposure and a fineness of detail in roentgenograms representing a radical improvement over the performance of tubes with stationary anodes.

An automatic timing device to control X-ray exposures was invented and placed in practical use on photoroent-genographic apparatus in 1944 by Dr. Russell Morgan and Dr. Paul C. Hodges. The device consisted of a photo-electric timing mechanism controlling electronically the length of photoroentgenographic exposures. It assured films of uniform density regardless of the thickness of the patient's chest. Its use greatly facilitated the application of photoroentgenography to mass surveys of the chest. At the close of the decade Drs. Morgan and Hodges had completed the necessary research and had constructed several

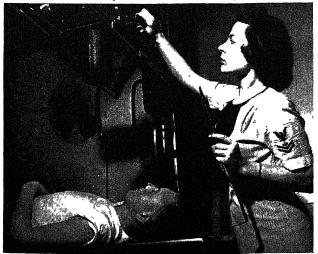

phototimers for use in general roentgenographic work. These were still in a somewhat experimental stage but there seemed no doubt that eventually the automatic electronic timer would be a part of standard X-ray equipment.

Photoroentgenography was one of the most important advances in medical roentgenology during the decade. It consisted in photographing the X-ray image produced on the fluorescent screen and was found especially applicable to examination of the chest and in mass surveys. About 20,000,000 chest examinations were made by this method of members of the U.S. army and navy during World War II. Its value for the detection of pulmonary tuberculosis was so thoroughly demonstrated that it became the chief weapon in the battle against this disease. It was found practical with a single apparatus to make photoroentgenograms of the chests of approximately 500 persons per day. The method came into use in various parts of the world, notably in the United States and in Sweden, in mass surveys of high school children and of industrial employees. It demonstrated its value as a public health measure by disclosing about 100 persons with pulmonary tuberculosis, not before suspected, in each 10,000 examined.

Photoroentgenography brought about renewed interest in cinemaroentgenography. At the beginning of the decade Maurice L. Van de Maele, of Brussels, and Russell J. Reynolds, of London, had succeeded in constructing different types of apparatus which were used successfully in diagnostic studies. The methods used were (1) photoroentgenography, in which the X-ray images were projected on a fluorescent screen and photographed and (2) the direct or roentgenographic method, which registered a considerable number of roentgenograms on a reel or series of films. The great improvement in the photoroentgenographic method which occurred from 1940 to 1946 made it readily adaptable to roentgenocinematography of the heart and intrathoracic blood vessels and of the oesophagus and stomach.

Angiocardiography.—A new method, called angiocardiography, for study of the anatomy and physiology of the heart and great blood vessels and for use in diagnosis of the circulatory system, was devised by George P. Robb and Israel Steinberg in 1938. It was the result of research carried out by them at the New York university college of medicine and the Third Medical Division of Bellevue hospital. The method depended upon the injection of a 70% solution of diodrast into one of the large veins of

X-raying a wounded veteran of Iwo Jima at the naval hospital, Bethesda, Md. The X-ray technician was a WAVE pharmacist's mate

the arm and the making of roentgenograms when the chambers of the heart and the blood vessels were opaque to the X-rays. Diodrast is an organic compound containing iodine which renders it opaque to the X-rays; its chemical formula is 3.5-diiodo-4-pyridone-N-acetic acid and diethanolamine. It was demonstrated that the following structures become visible upon roentgenograms taken at proper intervals following the injection: the superior vena cava and its tributaries, the four chambers of the heart, the ventricular walls and the interventricular septum, the tricuspid, pulmonic and aortic valves, the pulmonic and aortic sinuses, the pulmonary artery and the entire thoracic aorta and the branches from the arch.

The method was found to be safe and practical, and later reports by the originators and other investigators corroborated its value in diagnosis of a considerable number of intrathoracic diseases and abnormalities. They include congenital heart disease, coarctation of the aorta, aneurysm and various other conditions with associated changes in the size, position and contour of the heart and great vessels. Others reported on the use of the method in various heart diseases and still others on its use in diagnosing pulmonary embolism. At the end of the decade it was clear that angiocardiography had become of real value as a diagnostic aid in diseases within the chest, but it had not yet come into common use because of mechanical and technical difficulties. Improvements which were on the way in photoroentgenography gave promise of overcoming these difficulties and making the method generally avail-

Myelography.—In Dec. 1936 Aubrey O. Hampton and J. Maurice Robinson had published a report on the diagnosis of protruding intervertebral disc by injection of lipiodol into the spinal canal. Lipiodol had been used for diagnosis of tumours and other intraspinal lesions ever since its first introduction by J. A. Sicard and J. Forestier. Its use to demonstrate rupture and protrusion of an intervertebral disc, which often causes great pain and disability, was a definite advance. There were objections to the introduction of lipiodol into the spinal canal because of the fact that it is never absorbed and remains as a "foreign body" in the canal. To overcome this objection, Hampton and his co-workers later advocated the removal of the lipiodol through the lumbar puncture needle immediately alter the diagnostic procedure was completed. This was not constantly successful because of the viscidity of the lipiodol. The objections to lipiodol for myelography were completely overcome in 1942 when a new contrast medium called "pantopaque" (ethyl iodoundecylate) was devisedan iodized oil much lighter and less viscid than lipiodol. Because of its fluidity it could be manipulated to any locality within the arachnoid sac by tilting the patient on the movable table. It especially facilitated examination of the dorsal and cervical regions of the spine.

The greatest advantage of "pantopaque" was the ease with which it could be withdrawn through the same needle with which it was injected when the diagnostic procedure was finished. There was also evidence that even if a small amount remained in the spinal canal it disappeared after a few weeks, either disseminated in the spinal fluid or absorbed.

Cholecystography.—Advance was made during the decade in diagnosis of diseases of the gall bladder by the use of a new opaque medium named priodax (beta-[4-hydroxy-3.5-diiodophenyl]-alpha-phenyl propionic acid). At the end of the decade priodax had largely replaced tetraiodophe-

nolphthalein for cholecystography. It was found to have the following advantages:

- 1. Since it does not contain phenolphthalein it does not act as a cathartic. This assures better absorption since it remains in the small intestine for a longer time than tetra-iodophenolphthalein.
- 2. It is less toxic than tetraiodophenolphthalein although in some patients it does produce nausea and diarrhoea.
- 3. It is almost completely absorbed from the intestinal tract and therefore does not produce opacities which conflict with the gall bladder shadow.
 - 4. It is easily and simply administered in tablet form.
- 5. The gall bladder filling is better than with the older dye because of the complete absorption of the drug from the intestinal tract.

"Virus" Pneumonia.—During the latter half of the decade 1937–46 there were numerous reports, especially in the United States, from widely separated localities, of an acute disease of the respiratory tract. It was most commonly named "virus pneumonia" but received other names, among them "acute diffuse bronchiolitis," "influenzal pneumonitis," and "atypical pneumonia." Good descriptions of the disease were given by Worth B. Daniels and by Ben E. Goodrich and Henry A. Bradford. It differs from the common types of pneumonia in the absence of identifying organisms in the sputum, in giving few physical signs other than râles, in leukopenia instead of leucocytosis and in its relatively low mortality. It also differs from other pneumonias in its complete failure to respond to the sulfonamide drugs and to penicillin.

The X-ray changes in the lungs include small, diffuse, patchy areas of increased density; a fine, hazy or cloudy appearance which may involve an entire lobe; dense areas which closely simulate the consolidation seen in lobar pneumonia; and widespread miliary dissemination. Another characteristic is its tendency to persist in the lung and to show X-ray evidence of its presence long after clinical signs have disappeared.

X-ray Therapy.—Progress was made during the decade in the treatment of cancer by X-rays produced at very high voltage. A summary of 31/2 years' experience with 1,000,000 volt X-ray therapy at Memorial hospital in New York city, published in 1944, may be accepted as a consensus of the status of this type of therapy at the end of the decade. It was demonstrated by physical measurements that deep-seated tumours could be given a much larger dose of X-rays with safety to the normal structures than was possible with lower voltages. The report indicated that the 1,000,000 volt machine was not a substitute for the 200,000 volt unit. At not to exceed 7 or 8 cm. depth, the 200,000 volt unit gave nearly as great a dose as the 1,000,000 volt unit and because of its ease of manipulation was to be preferred. For deep-seated tumours, especially those near vital organs, the 1,000,000 volt machine was better than one giving lower voltages. It could not be stated that treatment at 1,000,000 volts constituted a spectacular advance, but the opinion was generally held by radiotherapists that the improvement was nevertheless real for treatment of deep-seated tumours. (See also CANCER; PHOTOGRAPHY; RADIOLOGY; STANDARDS, NATIONAL BUREAU of; Tuberculosis.)

Yachting

While many important events in yachting took place during the decade 1937–46, the most important single fact in connection with the period was the growth of the sport itself in spite of wartime conditions during more than half the decade. At the beginning of the period the sport was in full swing, but gathering war clouds soon put a damper on the international aspects. With the actual outbreak of the conflict, all except the most local and restricted kind of sailing became impossible.

Yet the sport was never wholly suspended. Large yachts were laid up or turned over to the naval services and did valuable work as patrol boats, etc. Even in American waters, large coastal areas were closed to pleasure craft, and others were available only under strict regulations. Most of the younger adult yachtsmen were in the services, and many others were in war industries far from their usual sailing grounds. Gasoline, sailcloth, rope, good paint and many other essentials of yacht equipment were either unobtainable or rationed.

For all that, sailing went on. The Englishman, barred from his coastal waters, occasionally managed a sail in a dinghy or other small craft in the lakes and rivers. (Incidentally, the evacuation of Dunkirk was in considerable part a "yachting event" which demonstrated what small craft, handled by amateurs, could do in a deadly emergency. The Blue Water medal of the Cruising Club of America was awarded to "British Yachtsmen at Dunkerque" for their part in the rescue of an army.) Some sailing managed to exist even in occupied countries, like the Netherlands, and the Star class international organization learned, after the war, that new boats had been built and sailed in the unoccupied part of France during the war. The United States, farther from the actual conflict, continued with a considerable amount of local racing throughout the war, although long distance events were impossible except on the Great Lakes; and some cruising was done in small boats, whose activities were restricted to daylight hours. The fleets were manned largely by under-service-age juniors, but many older men bowed down with wartime work and many servicemen home on furloughs, found relaxation in occasional sailing and racing.

In the years between 1940 and 1946 the trend, already evident in the earlier 1930s, was to smaller boats, but there were many more of them and they were sailed by many more people. Although the average tonnage of sailing craft in 1946 was only a fraction of what it had been in 1937, the numbers had multiplied many times. Already a popular sport at the beginning of the decade, the sailing of small yachts was established by the end of 1946 on a far broader and stronger basis than ever before, with many thousands of people of very modest incomes forming the backbone of what had once been considered a rich man's game. The spread of the sport during the ten

years demonstrated beyond doubt its vitality and its appeal to the ordinary man.

A minor but significant example of this was "G.I. yachting." From the dismal islands of the Pacific, where soldiers and sailors patched together all manner of strange craft out of odds and ends of salvaged equipment, to the lakes of Germany, where the occupation forces went out in "liberated" yachts, army and navy men from many lands found a way to go sailing.

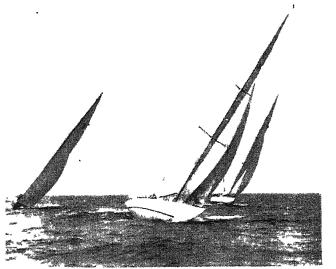

The America's Cup.—In the opening year of the decade, the outstanding event was the 16th match for the historic America's cup, blue ribbon of international yachting since 1851. In that year T. O. M. Sopwith, a British yachtsman who had been defeated in his first "Endeavour" in 1934, tried again with "Endeavour II," designed and built, like her predecessor, by Charles E. Nicholson. To meet the challenge, Harold S. Vanderbilt, skipper of the last two syndicate-owned defenders of the cup, "Enterprise" and "Rainbow," built "Ranger," designed jointly by W. Starling Burgess and Sparkman and Stephens, and built by the Bath Iron Works.

With the experience of his previous challenge, and with the first "Endeavour" for a trial horse in tuning up the new boat in U.S. waters, Sopwith was a more formidable challenger than he had been in 1934. But he was up against even tougher competition. In her early trials against "Rainbow" and "Yankee," "Ranger" never lost a race, and gave every indication of being a phenomenally fast yacht. She proved it against "Endeavour II." In four races held between July 31 and August 5, 1937, the issue was never in doubt. "Ranger" won by the margins of 17 min. .5 sec.; 18 min. 32 sec., 4 min. 27 sec., and 3 min. 27 sec. respectively in the four races. In contrast to the 1934 series, both the America's cup match and the less formal racing which followed, with the two British and three U.S. class J sloops taking part, was marked throughout by cordial good will and excellent sportsmanship.

"Ranger" was universally acclaimed the fastest Class J sloop ever built. Yet so abnormal were these huge and costly Class J sloops in the modern yachting scene that she was never commissioned again after her one triumphant America's cup season, and was broken up for junk early in World War II. The war forestalled another possible challenge, and there was no immediate postwar indication of early resumption of racing in yachts of this size.

Ocean Racing.—Ocean and long distance racing was one of the most prominent phases of the sport throughout the nonwar years of the decade, from the standpoint of increased participation, public interest and the development of new yachts and gear. The classic fixtures of the sport, such as the Bermuda and Honolulu races from the U.S. coasts, and the British Fastnet race, drew big fleets and fine competition up until the actual start of hostilities, and the Bermuda race was revived with 34 starters in 1946, after the war's end.

In the 1938 Bermuda race, which drew 43 starters, the winner was Henry C. Taylor's 72-foot yawl "Baruna," which continued to be an outstanding boat in cruising class competition throughout the period. The Class B prize winner, Richard J. Reynolds' "Blitzen," also started a career which subsequently included victories in the Honolulu and Mackinac races. The postwar revival of this event in 1946 saw Howard Fuller's sloop "Gesture," built in 1941, take top honours and Robert F. de Coppet's little yawl "Suluan," one of the few ocean racing craft built after the war and completed in time for the race, win in Class B. The fleet included a number of yachts built in the 1920s and early '30s, but they were generally outclassed

The "Vim," Harold S. Vanderbilt's yacht (foreground) which won the annual regatta of the New Rochelle Yacht club in Long Island sound June 29, 1940, despite a broken spinnaker pole

by the more modern ocean racing type sloops and yawls built after 1936.

The Fastnet, British equivalent of the Bermuda race, attracted fast fleets both in 1937 and 1939, with a Dutch entry, G. Bruynzeel's "Zeearend," winning in 1937. In 1939, Isaac Bell's yawl "Bloodhound," one of the most modern British ocean racers, was the winner with "Zeearend" second and a German entry, "Roland von Bremen," third. In the Honolulu races, from west coast ports, "Blitzen" was the winner in 1939 and D. W. Elliott's sloop "Escapade" defeated a small fleet that sailed the course in 1941. Both the Fastnet and Honolulu races were scheduled for revival in 1947.

Great Lakes yachtsmen were fortunate in having their waters open for sailing during the war, and the Mackinac Island races from Chicago, Ill., and Port Huron, Mich.—fresh water counterparts of the ocean events—went on uninterrupted. Among the notable winners were Henry Rubinkam's "Rubaiyat," John B. Ford Jr.'s "Royono II," James R. Lowe's "Manitou," Herman Kronstedt's "Hope," Fred S. Ford's "Evening Star," E. B. Lumbard's "Bangalore," A. Herrmann's "Gloriant," O. Dreher's "Lively Lady," "Blitzen" (then owned by Murray Knapp and Ernest Grates), Sumner Scott's "Breeze," the Timken brothers' "Kitty Hawk," C. E. Sorenson's "White Cloud," James Rider's "Carina" and others.

In addition to these few major events, scores of shorter races, from overnight to several days' duration, took an increasingly prominent place in the yachting calendars in U.S. and British waters and, after the conclusion of the war, to some extent in Scandinavian waters.

Six-Metre Internationals.—The International Rule sixmetre class, for many years a leading factor in international yachting, was as active as ever up to the outbreak of war in Europe. In 1937 the Scandinavian Gold cup and the Seawanhaka International Challenge cup were both held by the Seawanhaka Corinthian Yacht club at Oyster Bay, N.Y., and were successfully defended. Briggs S. Cunningham's "Lucie" defeated a fleet of boats from several countries for the former trophy, and Paul Shields's "Rebel" won a match for the latter.

In 1938, again off Oyster Bay, George Nichols' "Goose" successfully defended the Gold cup; a British-U.S. team

race was won by the Seawanhaka thio of "Goose," H. S. Morgan's "Djinn" and "Rebel"; and J. H. Thom, a Scottish challenger, sailing "Circe," took the Seawanhaka cup in a match series with "Goose."

By mutual agreement, the Gold cup races were held in Scandinavian waters in 1939, and again "Goose" was the winner.

Late in 1946 Seawanhaka challenged the Royal Northern Yacht club of Scotland for the Seawanhaka cup, the race to be sailed in six-metres the following year, and a challenge was expected for the Gold cup as well. However, postwar conditions had made six-metre racing an even more expensive sport than before the war, and there was a movement among yachtsmen on both sides of the Atlantic to attempt to establish another class of somewhat smaller and considerably lighter and less expensive yachts which should in time supplant the Sixes.

Other International Events.—The visit of Harold Vanderbilt's 12-metre sloop "Vim" to British waters in 1939 was so successful, from a racing standpoint, that it brought from Charles E. Nicholson, dean of British designers, the comment that there was little use in trying to beat U.S. yachts until the British had a model testing tank similar to those in which U.S. designs were tested and developed before the boats were built.

A Beverly Y.C. team of 30-square-metre yachts deteated a team of Swedish sloops of that class in a series on Buzzards Bay, Mass., in 1938.

The Star class functioned throughout the decade as a popular small boat world racing organization. The 1937 world's championship was marked by the appearance of Walter von Hutschler's German Star "Pımm," with a revolutionary rig having flexible mast and boom. "Pimm" broke down in that series, which was won by Milton Wegeforth's "Lecky," of San Diego, Calif., but she won the next two years in a row, with the result that the bending rig was adopted by most of the keener skippers of the world-wide class, which now included more than 2,000 boats. The visiting Star sailors in the 1939 world series at Kiel got out of Germany just as the German army marched into Poland. Starting with 1940 world champion Star skippers were James Cowie and George Fleitz, both of Los Angeles, Calif., Harry G. Nye of Chicago, A. M. Deacon of the Long Island Sound fleet, and Gerald Driscoll and Malin Burnham, both of San Diego.

The 14-ft. international sailing dinghies long popular in the British Isles and to a lesser extent in other European countries, Canada, the United States and elsewhere, were in the midst of an expansion in 1946 which indicated that these boats might figure more prominently in the international sailing picture.

Material, Designs, Rules.—World War II and its aftermath greatly increased costs of building and maintaining boats—approximately double prewar figures in some cases—and caused scarcities of materials and equipment. As a result, many experiments in new materials and methods were undertaken in 1945 and 1946. Hulls were built of moulded and sheet plywood, plastics of various sorts and aluminum, and steel was used in much smaller boats than had been common prewar practice. Nylon made its appearance in sails and rope, and aluminum spars became common in small craft.

Whether any or all of these materials would permanently replace the old standards of lumber, cotton and hemp, when the latter materials were again available, was a

The "Gesture" and the "Niña" just after the start of the 1946 races from Newport, R.I., to Bermuda. The "Gesture" took class A honours

source of considerable speculation. At least some of the substitutes seemed satisfactory and likely to become standard material.

A notable trend of the decade was the increase in the numbers and popularity of stock boats. Small stock one-design sailing craft, such as the Comets, Snipes, Lightnings, dinghies and other types, multiplied manifold, and a number of such classes each included several thousand boats by the end of the decade. They were organized on a national basis in many countries and, in some cases, on an international basis which promised further competition among yachting nations.

This swing to stock boats, partly for more equitable racing and partly for economy, spread during the decade from the small racing and day sailing classes to cruising auxiliaries up to 40 feet or more in over-all length. Many designers and builders offered such boats, and several hundred were built, some of which raced successfully among themselves and in coastwise and port-to-port races. Though a detriment to the progress of yacht design, the spread of these stock classes helped to popularize the sport.

The rules of the sport remained practically static during the decade, but 1946 saw a movement on both sides of the Atlantic to consider changes. These proposed changes embraced both the right-of-way rules of racing, which were practically standardized among all the active yachting countries, and the measurement rules, some of which were also international in scope. The changes appeared likely to be slow in taking final form and general acceptance, but national and international yachting organizations were working toward the desired ends at the close of the decade.

Yalta Conference

See International Conferences, Allied (World War II).

Yamamoto, Isoroku

Yamamoto (1884-1943), Japanese naval officer, was born April 4, 1884, at Nagoaka, Japan. He was graduated from the naval academy in 1904 and fought as an ensign in the Russo-Japanese war. He was naval attaché in the Japanese embassy in Washington, 1925. As Japanese delegate at the London naval conference in 1934-35, he successfully fought the Anglo-U.S. proposal to extend the naval "holiday." Yamamoto thereafter won rapid promotion. Foremost Japanese advocate of combining air and sea power in naval attacks, he was promoted to commander in chief of the fleet in 1939. Referring to the Japanese surprise attack on Pearl Harbor, Domei (Japanese) news agency revealed in a dispatch on Dec. 17, 1941, that the strategy of surprise carried out by Adm. Yamamoto was planned by him earlier (in Jan. 1941, according to Japanese documents seized after V-J day).

A Tokyo radio report of 1943 announced that he had been mortally injured in action while directing naval operations from a plane on a "far southern front," in

April 1943, and that he had died shortly afterward. The real facts of his death became known after V-J day in 1945. Through an intercepted Japanese message, Yamamoto's exact air itinerary was learned in advance by U.S. intelligence officers, who forwarded the information to the army air forces in the Solomons. A precise rendezvous with death was thus arranged for Yamamoto, whose plane was shot down by Lt. Col. T. G. Lanphier, Jr., over the Solomons on April 18, 1943.

Yamashita, Tomoyuki

Yamashita (? -1946), Japanese army officer, was a close student of German military tactics. An able strategist, he conceived the military plan for the Japanese invasion of Malaya, 1941–42. After a 10-wk. campaign, Singapore surrendered to Gen. Yamashita on Feb. 15, 1942. On March 9, Gen. Yamashita assumed command of the Philippine campaign. With a numerically superior army and air force, he won the battle of Bataan, April 9, and conquered the Corregidor island fortress, May 6, 1942.

After Gen. MacArthur's surprise landing of U.S. troops on Leyte in the Philippines Oct. 20, 1944, Gen. Yamashita assumed personal command of the resisting Japanese forces. His army was badly defeated in both the Leyte and Luzon campaigns and he surrendered at Baguio, Luzon, to Lt. Gen. Jonathan M. Wainwright on Sept. 3, 1945. Arraigned Oct. 8 in Manila before a military court on charges of being a war criminal, Yamashita pleaded not guilty and subsequently denied that he knew of atrocities committed in his command. Found guilty (Dec. 7) and sentenced to be hanged, he immediately filed an appeal through his counsels with the U.S. supreme court to contest the decision.

The U.S. supreme court on Dec. 17 granted Yamashita a stay of his execution until a decision could be made on its intervention in the case. But on Feb. 4, 1946, the supreme court finally turned down his plea, and he was hanged Feb. 23.

Yap

See Pacific Islands, Mandated; World War II.

Yarnell, Harry Ervin

Yarnell (1875–), U.S. naval officer, was born Oct. 18, 1875, at Independence, Ia. He was graduated from the U.S. Naval academy in 1897 and from the Naval War college in 1915. Commissioned an ensign in 1899, Yarnell served in the Spanish-American war, the Philippine insurrection, the Boxer rebellion and in the occupation of Vera Cruz (1914).

During World War I, he commanded the U.S.S. "Nashville" on patrol duty at Gibraltar and in 1918 he was appointed to Adm. Sims' staff in London. Yarnell was named chief of the Naval Bureau of Engineering and raised to the rank of rear admiral in 1928. Three years later, he became commander of the aircraft squadrons of the battle fleet and in 1933, he was appointed commandant of the Pearl Harbor naval station. Advanced to commander-inchief of the U.S. Asiatic fleet in 1936, he achieved renown for his consistent refusals in 1938–39 to submit to early Japanese efforts to restrict U.S. commercial and naval privileges in China.

Upon his retirement in 1939, congress voted him a distinguished service medal. After the close of World War II, Adm. Yarnell urged that the U.S. retain its Pacific island bases until such time as the United Nations trustee

council had reached a stage of maturity and responsibility.

Yeast

Fundamental studies of yeast metabolism during the decade 1937–46 helped explain not only the mechanisms of termentation and respiration, but also the basic relationships existing between vitamins and enzymes. The enzyme hydrogenase was isolated from yeast in pure form. The chemical nature of yeast ribonucleic acid was explored. Establishment of the stimulating effect of certain B complex vitamins upon either growth or alcoholic fermentation by yeast led to use of yeast in microbiological assay methods for these vitamins.

Numerous secondary sterols of yeast were studied, and improved methods were perfected for manufacturing ergosterol from yeast. Other industrial advances were development of active dry yeast for baking, and cultivation of torulopsis yeasts for feed and food uses. Progress in utilization of by-products for yeast cultivation included the use of wastes from fruit processing industries and the invention of a speedy method for hydrolyzing wood wastes to make carbohydrates for growing yeast. New types of yeast extracts and yeast derivatives were perfected. A process was invented for manufacturing bakers' yeast high in thiamin (vitamin \mathbf{B}_1) by growing in a substrate containing thiamin intermediates.

The *Pharmacopoeia* of the U.S. set up specifications for dry yeast for pharmaceutical use. Nutritive and therapeutic values of yeast were clarified by establishment of its content of the vitamins folic acid, biotin, choline, inositol, pyridoxine and pantothenic acid, and of the essential amino acids. Use of irradiated dry yeast to produce metabolized vitamin D milk was discontinued, but irradiated dry yeast gained increased use as a source of vitamin D for four-footed animals.

Yeremenko, Andrei Ivanovitch

Yeremenko (1892–), Russian army officer, was born Oct. 14, 1892, at Markova, in the Ukraine. He was conscripted into the Imperial Russian army in 1913 and saw service in World War I on the eastern front. After the peace of Brest-Litovsk, Yeremenko became a guerrilla and joined the Red army during the revolution, serving later as an officer in a cavalry unit. Yeremenko subsequently studied at the High Cavalry school, the Military-political academy and the Frunze Military academy. He was given command of a field army on the northwest front in 1941 and was assigned to the Stalingrad front in late 1942. Yeremenko was wounded seven times in the historic struggle for the Volga city. Decorated with the Order of the Red Banner, he was promoted first to the rank of colonel general and then full general in Aug. 1943.

In 1944, Yeremenko directed the special maritime army in the Crimean drive that culminated in the recapture of Sevastopol. In July of that year, he was given command of the 2nd Baltic army and participated in the reconquest of Latvia. Toward the close of the war early in 1945,

Y.M.C.A.

See Young Men's Christian Association.

Yonai, Mitsumasa

Yonai (1880-), Japanese naval officer and politician, was born in March 1880 in Morioka, Iwate prefecture. Graduated from the Naval academy (1901), he served in the Russo-Japanese war, 1904-05, subsequently rising rapidly through the grades. He was navy minister in the Hayashi cabinet, 1937-39, and was named supreme war councillor in Aug. 1939. Emperor Hirohito called on Yonai on Jan. 14, 1940, to form a cabinet. His selection as premier was regarded as a surprise victory for the socalled moderates as opposed to the army extremists. Yonai assertedly objected to extremist demands that Japan join the Rome-Berlin axis, and he was forced from the premiership on July 16, 1940, by Gen. Hideki Tojo, who was then the acknowledged leader of the ambitious military clique. Subsequently, when Tojo was ousted from the premiership (July 1944), both Gen. Kuniaki Koiso and Adm. Yonai were asked (July 20) to form a cabinet and rule as copremiers. However, Gen. Koiso assumed the premiership and Yonai was allocated the post of navy minister. Yonai was also navy minister in the Suzuki government and in the surrender cabinet formed by Prince Naruhiko Higashi-Kuni, Aug. 16, 1945. He was retained in the Shidehara cabinet formed in Oct. 1945, but not in the succeeding Yoshida government (May 1946) in which the navy portfolio was dropped.

York, Archbishop of

See GARBETT, CYRIL FORSTER.

Yoshida, Shigeru

Yoshida (1878—), Japanese politician, was born Sept. 22, 1878, in Tokyo. He was educated at Tokyo Imperial university, graduating from the Law college in 1906. The same year, he entered the diplomatic service, and from 1916 to 1917 he was a second secretary at the Japanese embassy in Washington. He was Japan's minister to the Scandinavian countries in 1928, vice-foreign minister, 1928—30, and ambassador to Italy, 1930—32. Yoshida made a special tour of Europe in 1934, trying to justify Japan's seizure of Manchuria and to soothe diplomatic feelings ruffled by his country's subsequent departure from the League of Nations. From 1936 to 1939 he was ambassador to London.

Toward the close of World War II, Yoshida was arrested as a peacemonger. After Japan's surrender, he was freed and became foreign minister in the Shidehara cabinet, Oct. 6, 1945. There was some tepid criticism of Yoshida's appointment because of his previous associations with the Zaibatsu (Japanese "big business").

On May 15, 1946, Yoshida accepted the presidency of the Japanese Liberal party; the following day he was named successor to Shidehara as premier; his cabinet was sworn in May 22.

Young Men's Christian Association

In 1937, there were 10,380 local Young Men's Christian associations in 66 countries, with more than 2,000,000 members, chiefly youth. In that year, the 21st world conference was held at Mysore, India, evidencing an interracial, intercultural, international and interreligious bond that had continued and grown stronger for almost a cen-

Such an organization was among the first to feel the impact of World War II. Except in a few neutral lands, the young men of the membership were first under arms and in combat. The various Y.M.C.A. national alliances promptly made their experience and facilities available to their governments, and the record of their contribution to the youth of their respective countries, whether under arms or in civilian life, became notable.

Among the Allied nations, the national Y.M.C.A. organizations of England, Canada, China, Australia, New Zealand, India, Poland and other countries accompanied the armed forces everywhere. Veterans of Dunkirk, El Alamein, the North African campaign and the defense of England found the services of tea vans in the field, clubs in the staging points and cities and at leave centres. When Japanese occupation of China caused whole cities to trek westward into the interior, Y.M.C.A. members and leaders among them were immediately active in organizing new centres and services. The direct service among the Chinese armies was extensive and included distant contingents in Thailand, Burma and India. When Poland was overrun, Y.M.C.A. activity was at once begun among the army remnants and refugees who made their way into Hungary and Rumania until finally this Polish Y.M.C.A. service was continued in 151 centres in Palestine, Syria, Egypt and in five countries in East Africa, as well as in western Europe.

In America, where government policy did not permit direct service by religious organizations and groups as such or allow them to go with military expeditions abroad, much was done within continental U.S. and in offshore bases, by the United Service Organizations (q.v.), a newlyformed body of which the Y.M.G.A. was one of the six founding member bodies. With official recognition by the government, this service provided extensive social, recreational, educational and religious programs adjacent to military establishments, in leave centres, in transit and in certain army bases from Iceland and Brazil to Alaska, Hawaii and the Philippines.

In Germany and other central and occupied countries in Europe, ruling regimes began, even before the outbreak of the war, to place certain restrictions upon Y.M.C.A. activities. Programs for boys were prohibited in Germany. A limited program among young men was allowed for a time, protected in a measure by church sponsorship. However, even after occupation, as in Czechoslovakia, Poland, France and other countries in western Europe, some activity continued, though usually with considerable risk. In Japan, where the Y.M.C.A. had earlier been included by government order in the general framework of the National Church of Christ, it was possible to continue some service among Japanese in Manchuria, China and Korea. Local Y.M.C.A. work continued in China and the Philippines under Japanese occupation, sometimes under great deprivations and in the midst of destruction. More than 80 Y.M.C.A. buildings in various countries were wholly or partially destroyed, 13 of them in the Philippines alone. Many secretaries were long imprisoned. Most of them suffered infamous cruelties, and some of them lost their

War Prisoners' Aid.—In World War II, as in World War I, the Y.M.C.A.'s work among prisoners of war became an outstanding feature. Under the World's Alliance of Y.M.C.A.s, in accordance with provisions of the Geneva convention of 1929, the Y.M.C.A. accepted responsibility

for conducting recreational, educational and religious programs among war prisoners wherever reciprocal agreements negotiated with belligerent nations opened the way. Using more than 150 neutral staff representatives as visitors, with service and supplies costing almost \$17,000,000, this grateful activity reached its crest in the spring and summer of 1945. Official permission was granted to visit prisoner of war camps and supply material was granted for 33 countries, while prisoner contingents in 20 more received shipments of supplies. These visits and services were not allowed in the case of soviet Russia, nor were visits allowed in Italy. Earlier restrictions by Japan were gradually liberalized to permit visits and supplies in certain areas.

Wartime Centennial.—The Y.M.C.A.'s world centennial in 1944 found the association's own members in nearly all countries engulfed in unprecedented wartime demands. Nevertheless the observance was world-wide. A solemn service of thanksgiving and dedication, in which the king of England and other international notables took part, was broadcast from St. Paul's cathedral in London, almost on the spot where young George Williams and 11 fellowworkers in Hitchcock's store organized the first Young Men's Christian association in 1844. On every continent and unto the uttermost parts of the earth, friends in community and public life joined with members and leaders of every race and faith in a tribute that represented gratitude and expectancy.

Reconstruction.-Long before the war's end, association leaders of many nations had begun to plan for reconstruction and the future. An enlarged executive meeting of the World's committee at Geneva, Switzerland. Feb. 28 to March 8, 1946, laid plans for reconstruction and extension around the world. The steadily diminishing work among prisoners of war was voted continuance through 1947 with a budget of \$800,000. Fresh opportunities among prisoners returning home were widely reported. A petition for reinstatement in the World's Alliance of Y.M.C.A.s, by representatives of the German Y.M.C.A., which had abruptly withdrawn from the World's Alliance of Y.M.C.A.s in June, 1939, was granted after searching consideration. Plans for visitation and survey among seven major regional divisions of the world were activated. From North America was reported the launching of a World Youth Fund for Restoration and Advance with a goal of \$8,650,000 for restoring personnel and buildings in war-occupied countries and for emergency assistance in meeting war-created needs now faced by Y.M.C.A.s in their service among youth around the world.

Young Womens Christian Association

During nearly the whole of the ten years from 1937 to 1946 the Young Womens Christian association was involved in the problems of war. In 1937, when China was invaded by Japan, the Y.W.C.A. of the United States began to raise special funds to help the Y.W.C.A. leadership of China to meet their problems, one of which was moving westward into free China in 1941.

In the fateful days of Sept. 1938 the World's council met in Canada, working at that meeting on the problems of the Y.W.C.A. throughout the world, such as the needs of youth and the desirability of co-operating with youth organizations, the Y.W.C.A. as a Christian women's movement, its contribution in the oecumenical and social fields, and its responsibility in the field of international relations. But surrounding these discussions was the impending horror of war.

Through the months and years that followed, the Y.W.C.A. throughout the world endeavoured to relieve suffering, provide cheerful and homelike atmosphere in clubs and hostels for women in the services of the Allied nations, and in all possible ways to mobilize the services of women as leaders and to meet the needs of war victims everywhere.

The Y.W.C.A. in Great Britain was early requested by the government to work as a private agency with girls and women in munitions factories and in the war services, both in Britain and overseas. The house built on the Nile for nurses worn out by their arduous duties, the hostel in Eritrea, vacation lodges in India and Italy, wherever they could be set up, and club centres for service women and Red Cross nurses just back of the front lines in Africa, Italy, Europe and southeast Asia—all were examples of the type of work carried on. In this work of the British War services the Y.W.C.A. of the U.S. co-operated by assigning American staffs to them and grants of money for their programs.

In the U.S. the Y.W.C.A. was one of the six organizations in United Service Organizations (q.v.), working with men and women in the vicinities of the camps and in war production areas. Through its participation in the National War fund it was possible for the Y.W.C.A. to work overseas in connection with the British War services and independently, and also to serve war victims in the U.S.refugees, interned enemy alien women and Japanese evacuees. In the U.S. the Y.W.C.A. worked also through American War-Community Services, Inc., in industrial communities. Meanwhile, in the U.S., in Great Britain and in other countries, the Y.W.C.A. endeavoured to maintain its so-called regular work with women and girls-recreation, housing, club centres, discussion groups, personal counselling. Much of the work carried on in these years was in co-operation with other organizations. Never before had the Y.W.C.A. drawn so close to the other organizations with a similar purpose, the churches, the Y.M.C.A., the youth movements and many government agencies.

Three national conventions were held in the United States during the decade 1937-46: in 1938 at Columbus, O., where special emphases recommended for the following biennium were religion, democracy and building a world community: in 1940 at Atlantic City, N.J., the world already at war and the question being asked "Should the United States participate?", the Y.W.C.A. considered the tremendous needs it was endeavouring to meet overseas; and in 1946, when the actual hostilities were over, another large meeting in Atlantic City with more than 2,300 delegates from the U.S. and representatives from 26 foreign countries coming together to look at the situation facing this international Christian women's organization, and to determine its task for the following three years. Of particular significance was the report on interracial practices in the U.S. and the determination to move forward in the light of this report. At the end of the decade, the Y.W.C.A. was working in 69 countries and in the U.S. alone had a constituency of nearly 3,000,000. (M. S. Ss.)

Youth Administration, National

See NATIONAL YOUTH ADMINISTRATION.

Yugoslavia was established after World War I as the kingdom of the Serbs, Croats and Slovenes, and received the name Yugoslavia officially in 1929. Under King Peter II in 1941 it rejected German demands for collaboration; as a result of German aggression it was defeated and partitioned in 1941. It was liberated in 1945 by Russian and British armies and by the partisans under leadership of Marshal Tito (Josip Brozovich or Broz). Area 95,558 sq.mi.; pop. (est. Jan. 1, 1940) 15,703,000. Capital (1931 census): Belgrade, 238,775. Other chief cities: Zagreb, 185,581; Subotica, 100,058; Ljubljana, 59,767; Sarajevo, 78,173. Religion: 6,785,501 Greek Orthodox; 5,217,910 Roman Catholic; 1,561,166 Mohammedans; 231,169 Protestants; 68,405 Jews.

At the beginning of the fateful decade in 1937, Yugoslavia was a constitutional monarchy; the king, Peter II, had succeeded to the throne on Oct. 9, 1934, at the age of 11. During his minority a Regency council governed under the king's uncle Prince Paul; the premier and minister of foreign affairs was Dr. Milan Stoyadinovitch. The year 1937 seemed to strengthen the country's interests and position. A treaty of friendship with Bulgaria, signed on Jan. 24, secured her eastern flank, and inaugurated an era of genuine good feeling. On March 26, a political and a commercial treaty was signed with Italy. The two countries undertook to respect their common frontiers on land and in the Adriatic. If either were attacked without provocation by one or more powers, the other would abstain from action calculated to help the aggressor. Each would inform the other of measures taken to safeguard itself in international crises. Both agreed not to resort to war as an instrument of their national policies, and to settle their differences by peaceful means. They would not tolerate on their territories activities directed against each other's territorial integrity or political independence, or calculated to disturb their existing relations. It was understood that they exchanged assurances to respect the integrity of Albania, and not to seek exclusive advantages in that country. Under the trade agreement, Yugoslavia got increased exports to Italy, participation in the benefits of the Rome protocols and an active trade balance with

While remaining formally faithful to the Little Entente and Balkan Entente, Yugoslavia leaned more and more toward the fascist powers and also improved her relations with Hungary. But many Yugoslavs felt that Stoyadinovitch was going too far in cultivating the friendship of Italy and Germany, which he visited on Jan. 15, 1938, being warmly received. Hitler stressed Germany's interest in "a strong and independent Yugoslavia," while after the occupation of Austria he declared Germany's new frontier with Yugoslavia inviolable. The premier therefore expressed no misgivings about the occupation, although the opposition was less complacent, particularly in view of nazi agitation among the Germans of Yugoslavia, and alleged oppression of the Slovenes in Carinthia. Yugoslavia in 1938, at the time of the Czechoslovak crisis, abandoned the Little Entente and thought that she could watch the Czechoslovak crisis (in which she declared herself neutral) with comparative detachment.

Serb-Croat Problem.—Internally Yugoslavia enjoyed considerable prosperity, largely owing to her increased trade with Germany, and her industrialization proceeded. But Yugoslavia's most vexing problem remained unsolved: the relations between the two leading Slav peoples forming Yugoslavia, the Serbs and the Croats. There the political

deadlock continued. Vlatko Machek, the Croat leader, who had been in touch with the Serb opposition during 1938, visited Belgrade on Aug. 14, and the arrangements for collaboration concluded in 1937 were confirmed. In the December elections the Popular Entente representing Machek's Croat Peasant party and the Serb democratic opposition, increased its vote considerably, polling 40.21% of the total votes cast, and gaining very large majorities in Croatia and Dalmatia. The government list, which polled 59.8% of the votes, was successful chiefly in Serbia and Slovenia. The government bloc secured 304 seats in the new chamber, the opposition 68 seats.

Though the electoral law gave the government a disproportionate majority of seats, the necessity of an understanding with the Croats was generally recognized. On Feb. 4, 1939, the government was reconstructed with Dragisha Cvetkovitch as premier in place of Stoyadinovitch. It was at once announced that the government meant to solve the Croat question; it was understood also that it hoped to return to more constitutional methods. Serbo-Croat negotiations began at once, but many difficulties arose, including that of delimiting the Serb and Croat areas. On April 27, 1939, it was announced that agreement had been reached, but a later announcement stated that the prince regent had refused his consent to the agreement, which included provision for a representative government of concentration. Only on Aug. 25, after feeling had risen very high, were fresh proposals sanctioned. A new government was now formed, including five members of the government party, five representatives of the Croat party, and three of the Serb opposition. Cvetkovitch remained premier and Alexander Cincar-Markovitch foreign minister. The two Croat banovinas (provinces), with seven adjacent districts, amounting to 20% of the area of Yugoslavia, with a population of 4,423,000 (3,052,000 were Croats and 360,000 Serbs) were formed into a new banovina under a Croat ban (appointed and dismissible by the crown), and with its own diet at Zagreb. The banovina enjoyed very wide autonomy, but foreign affairs, defense, foreign trade, public security, religion, commerce, transport, mining, weights and measures and general educational policy were reserved to the central authorities. The first ban was Ivan Shubashitch. Parliament was dissolved and the government was empowered to hold new elections. The agreement was hailed with wide-spread enthusiasm, although it left many questions to the future: the organization of a Slovene banovina, the position of the Voivodina, Montenegro, Macedonia, and above all of Bosnia and Hercegovina, a bone of contention among Serbs, Croats and Moslems.

Efforts to Remain at Peace.—In Feb. 1939 the government had stated that its foreign policy would be unchanged, but the departure of Stoyadinovitch was generally interpreted as meaning less enthusiasm for Germany and more for the democracies. Visits were, however, exchanged between the Yugoslav and Italian foreign ministers, and Italy's occupation of Albania was taken quietly. Yugoslavia continued efforts to reconcile Bulgaria and to mediate between Rumania and Bulgaria, and also between Rumania and Hungary, with whom her relations improved remarkably. On the outbreak of World War II, Yugoslavia declared her intention to remain neutral.

In the following year Yugoslavia's main concern was, in view of the war, her foreign policy. Yugoslavia pursued a policy of strict neutrality, although it leaned toward the axis, partly out of weakness and geographic conditions,

partly out of the inclinations of a certain group of political leaders like the former Prime Minister Stoyadinovitch and the Slovene leader Father Anton Koroshetz, the minister of public education and president of the senate, who died on Dec. 14, 1940. At the conference of the Balkan Entente in Belgrade at the beginning of February, Yugoslavia opposed all moves toward stronger Balkan solidarity against any outside aggression, and generally took a line in harmony with Italy. But the Belgrade government took energetic measures when, in the middle of April 1940, the Yugoslav police unearthed a fascist plot under the leadership of Stoyadinovitch, who was exiled from the capital to a distant provincial town. The great successes of Germany in the late spring of 1940, Italy's entrance into the war and France's surrender, induced Yugoslavia to follow a more cautious policy and to release Dr. Stoyadinovitch.

The grave reverses suffered by the Italian army in its war against Greece awakened in the Yugoslav army and the war minister, General Milan Neditch, the desire for an active policy on the part of Yugoslavia to prevent a fate similar to that which had befallen Rumania, but the tendency of Father Koroshetz prevailed and General Neditch resigned. A commercial pact with Germany on Oct. 19, 1940, subordinated Yugoslav economic life to the exigencies of German economy. At the beginning of December the Hungarian foreign minister, Count Csáky, visited Belgrade and concluded on Dec. 11 a treaty of "everlasting friendship" between the two countries.

On Feb. 13, 1941, Premier Cvetkovitch and Foreign Minister Cincar-Markovitch went to visit Hitler. Long negotiations followed, and meanwhile Bulgaria's adherence to the axis pact put Yugoslavia into a very unfavourable strategic position. At the same time, the agitation of Croat extremists and the fascist-terrorist group of the Croat Ustashi under the leadership of Dr. Ante Pavelitch, who directed the movement from Italy, caused concern to the Yugoslavs.

The Yugoslav government tried to arrive at a compromise with Germany, which demanded not only signature of the axis pact but permission to send troops down the Morava and Vardar valleys into Greece, and additional military, political and economic concessions binding Yugoslavia firmly to the "new order." While the government deliberated, the democratic Serb parties, who represented the vast majority of the Serb population, organized an opposition to Yugoslavia's submission to Germany. The German minister to Yugoslavia, Viktor von Heeren, negotiated secretly with minority groups in Yugoslavia, promising freedom to the separatist groups in Croatia and Bosnia in exchange for their promise of neutrality in case of a Yugoslav-German conflict. The Yugoslav government tried to substitute a friendship and nonaggression pact with Germany for the demanded full membership in the axis. For several days the nation seemed to fluctuate between acceptance and resistance. Popular temper among the Serb civilians and the Serb army definitely changed in the latter direction. When, on March 20, 1941, the Yugoslav cabinet accepted the German final terms for a settlement which would take into account the nonactive character of Yugoslav co-operation with the "new order," the unrest of the Serb people grew hourly.

In the early morning hours of March 27, 17-year-old King Peter II took over the government of the country, Prince Paul fled, and a new government under Gen. Dushan Simovitch, chief of the Yugoslav air force, was formed. In the new cabinet the Croat leader, Dr. Vlatko

Machek, was first vice-president. Thus the Serbs under King Peter and the Serb army officers dared to challenge Germany, then at the peak of power, opposed only by Britain, with Russia still friendly to Germany.

The German Blow Falls.—The time left to the new government to prepare for the struggle with Germany was much too short. On April 6, 1941, the German invasion began simultaneously through Hungary and Bulgaria, and by April 16 the Yugoslav army had disintegrated. King Peter and his cabinet were forced to flee and to continue their struggle against Germany from abroad. (For an account of the Yugoslav campaign, see WORLD WAR II.)

Large parts of the country were annexed outright by Bulgaria, Hungary, Germany and Italy. Southern Serbia (Macedonia) was annexed by Bulgaria; northeastern Yugoslavia and the fertile plains of the Bachka, were annexed by Hungary, while Slovenia was divided between Germany, which annexed the northern part, and Italy, which annexed the southern part as an autonomous province of Ljubljana. Out of the remaining part of Yugoslavia, an "independent" new kingdom of Croatia was created, while in rump Serbia, under a German-instituted government of General Milan Neditch, the Serb population under Chetnik leadership continued the struggle against the German invaders with an indomitable courage and an unparalleled heroism. Meanwhile the legal Yugoslav government functioned in London, where it had found temporary refuge as one of the allied governments.

Life in Yugoslavia throughout the following years presented a very unhappy picture. The country was divided into several parts, occupied by the troops of four foreign nations and in addition torn by bitter internal strife. Croatia was organized as an outright fascist state with Ante Pavelitch as fuehrer or poglavnik. The fascist militia, the ustasha, terrorized the population, especially the Serbs and the Jews. Many Serbs and Jews were ruthlessly massacred. Officially Croatia was under Italian influence. On May 15, 1941, the restoration of a monarchy in Croatia, which had become extinct in A.D. 1089, was officially announced in Rome. The crown of Zvonimir, the last Croatian king, was offered to the Italian Prince Aimone, Duke of Spoleto, who became King Aimone I on May 17

Partition of Yugoslavia among Germany, Italy, Hungary, Rumania and Bulgaria after the axis conquest of April 1941

without, however, ever setting foot in his kingdom. Croatia had, at the beginning, an area of 44,454 sq.mi. with 7,000,-000 inhabitants, but large parts of Dalmatia though inhabited by Croats were either annexed to Italy or controlled by the Italian army. Croatia aligned itself completely with the axis; a small part of the new Croatian army fought in Russia with the Germans, but its main part was used for the suppression of internal opposition. After the surrender of Italy in Sept. 1943, King Aimone was deprived of his throne and Croatia became a republic under German protectorate. Throughout the war a number of German, Italian, Hungarian and Bulgarian divisions were kept busy in Yugoslavia suppressing and counteracting the military activities of the Serbs. The unrest was increased by the internal struggle between Croats and Serbs which led to much bloodshed and bitterness.

Split Among the Patriots.-It was most difficult to get an exact picture of the operations conducted by the Yugoslav patriots against the axis forces and the satellite governments. The Serb patriots (Chetniks) were under the command of General Draja Mikhailovitch, who had been recognized by the Yugoslav government as commander in chief of the Yugoslav armies. Under his leadership the troops of the patriot army succeeded in breaking up axis communications, controlling at various times large parts of the country and supplying themselves from provisions captured from the axis. They also maintained a broadcasting station which was in communication with the Yugoslav government in London. Yet the problem of getting supplies became more and more difficult, as it was almost impossible to send any supplies from outside. During 1942 a serious split occurred within the patriot army. Groups of Partisans, some inspired by communism, others by nationalism and others again probably only by the general misery and unrest, undertook operations on their own account and found themselves soon in opposition to General Mikhailovitch.

Toward the end of the year accusations were levelled against Mikhailovitch of abandoning the struggle and seeking terms with the axis powers. The Yugoslav government in London, however, expressed its unchanged confidence in Gen. Mikhailovitch's loyalty. By the end of 1942 the internal situation of Yugoslavia presented a rather confused picture, yet in different parts of the country, especially in those occupied by Italians, the struggle went on relentlessly, and the patriot forces could always point toward some local successes.

Meanwhile the Yugoslav government in London was reorganized at the beginning of 1942. General Dushan Simovitch was succeeded as premier by Slobodan Yovanovitch, a former professor of the university of Belgrade. At the same time General Mikhailovitch was appointed minister of war, and Milan Gavrilovitch, former Yugoslav minister in Moscow, was made minister of justice. The new premier was well known as a promoter of Balkan unity. In July General Mikhailovitch was named chief of staff and was given full military and administrative power in the Yugoslav territory. In recognition of Yugoslavia's importance the U.S. raised its diplomatic mission to the Yugoslav government from a ministry to an embassy, and the Yugoslav minister in Washington, Constantin Fotitch, became Yugoslav ambassador.

The situation in Yugoslavia continued throughout 1943 in a troubled state, further complicated by the collapse of Italy. The unrest and bitterness produced by the occupation of Yugoslavia was also much increased by the continued internal struggle among the Yugoslavs themselves. Mikhailovitch continued as commander of the Chetniks,

but a new figure had arisen to challenge his leadership of the Yugoslav resistance. This was Tito, who, by 1943, had secured firm control of the oppositionist Partisans.

The forces of Mikhailovitch represented mainly the Serb army and guerrillas, while those of Tito included Serbs, Croats and Slovenes and were of a more leftist political conviction, often representing communism, yet accepting in their ranks men of all parties and classes, peasants, workers, intellectuals, officers and priests.

The exile government in London, recognized as one of the United Nations, reflected the internal strife of the homeland and was frequently reorganized. The cabinet of Slobodan Yovanovitch resigned on June 17, 1943, because it was unable to define a satisfactory postwar policy. On June 26 a new cabinet was formed with Milosh Tritunovitch, deputy leader of the Serb radical party, as premier and Milan Grol, leader of the Serbian democratic party, as minister of foreign affairs. In a broadcast on June 28, a national holiday of the Serbs, King Peter promised his people that after their liberation they would be free "to decide on their own fate in conformity with the principles of democracy."

As a result of Serb-Croat tension the new cabinet resigned on Aug. 10, 1943, and was followed by a cabinet with Dr. Bozhidar Puritch, a Serb diplomat, as premier. The Yugoslav government transferred its seat at the beginning of October from London to Cairo. From there on Oct. 7 King Peter called on his people to "obey Mikhailovitch and other national leaders of your resistance to the enemy and refrain from internal struggles." Thereby the king recognized officially the existence of other liberation movements, especially that of Tito. On Oct. 16 the Yugoslav government was broadened by the inclusion of three new members, two Croats and one Slovene.

Meanwhile the struggle in Yugoslavia went on. The partisan armies were able to wrest important territory from the Germans, and at times many important cities in Dalmatia and Bosnia were entirely under patriot control. But the attempts of creating a united front of the patriots failed. On Dec. 4, 1943, the Partisan movement announced that it had set up a provisional regime in opposition to the existing Yugoslav government in exile. It was reported that 240 delegates had created in Jajce, Bosnia, a parliament and government for the territory already won back from the Germans. Dr. Ivan Ribar, first president of the constitutional assembly of Yugoslavia since World War I, was elected head of the government of the Antifascist Council for the National Liberation of Yugoslavia (Antifašističko Vječe Narodnog Oslobodjenja Jugoslavje or A.V.N.O.J.), and Tito was named field marshal and chairman of the committee for national defense. A regular cabinet was formed, the three vice-presidents being respectively a Serb, a Croat and a Slovene. In the British parliament it was disclosed officially on Dec. 8, 1943, that the larger part of British supplies and arms sent to Yugoslavia had been going for some time to Tito's forces, with whom the British had established military liaison earlier in the year. On Dec. 14 Foreign Secretary Anthony Eden announced that the British military mission was headed by Fitzroy Maclean, a former member of the British foreign office. The soviet government followed the British example and announced on Dec. 14 that it would also send a military mission to Yugoslavia. By the end of Dec. 1943, the hostility between Tito's Partisans and the government in exile took on more and more violent form. Tito's council issued a manifesto depriving the government in exile

of all rights and accusing Mikhailovitch openly of a hostile attitude and of organizing civil strife. The government in exile denied these charges and maintained the legitimacy of its position.

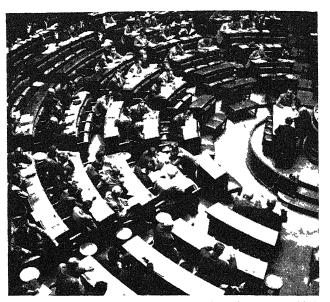

Tito Eclipses Mikhailovitch.—In the following months, British and Russian backing of Marshal Tito became more and more pronounced. British pressure was increased on the foyal Yugoslav government under King Peter to drop General Draja Mikhailovitch as minister of war and to seek an agreement with Marshal Tito.

At the end of Jan. 1944 a national congress was held secretly in Serbia by the followers of Mikhailovitch. The delegates expressed their loyalty to King Peter and to the exile government. Dr. Zhivko Topalovitch, a Serb labour leader, was elected president and Rusomir Yankovitch, a member of the Serb peasant party, vice-president of the congress. A constitution was drafted for Yugoslavia as a tederation based upon the equality of Serbs, Croats and Slovenes. On the other hand several Serb leaders, including General Dushan Simovitch, who led the coup d'état in 1941 against collaboration with Germany, came out in favour of Yugoslav unity under Tito's leadership. The Yugoslav ambassador to the soviet union, Stanoye Simitch, took a similar stand against Mikhailovitch and against King Peter's government, still headed by Puritch. Marshal Tito demanded the recognition of the National Liberation committee headed by Dr. Ivan Ribar. He wished this committee to be recognized as the provisional government of Yugoslavia with representatives in the different inter-Allied commissions.

A decisive turn of events occurred in May 1944, when King Peter dismissed the government of Puritch and asked the Croat leader, Dr. Ivan Shubashitch, to form a government and to try to arrive at a reconciliation with Marshal Tito. General Vladimir Velebit, who was in London as Marshal Tito's ambassador, had a number of conversations with Churchill, who decided to back Tito openly. The United States, following the British and Russians, established a military mission at Tito's headquarters in 1944, headed by Col. Ellery C. Huntington, Jr.

On July 7, 1944, Dr. Shubashitch succeeded in forming a government in which he himself took the portfolios of foreign affairs and war. The new cabinet consisted of six members, two from each of the three national groups, Croat, Slovene and Serb. In his statement the new premier recognized the principle of a federated Yugoslavia but expressed also his attachment to the king and the monarchy. Thus the groundwork was laid for apparent collaboration between the royal government in exile and Tito's Committee of National Liberation. But part of Serb public opinion was apparently not satisfied. Constantin Fotitch, Yugoslav ambassador to the U.S., resigned his position in protest against the formation of the new government, which in his opinion did not represent the Serbs.

The temporary agreement between the royal government and Marshal Tito followed a meeting between Dr. Shubashitch and Tito in Yugoslavia on June 16, 1944. As its result the decisive influence in Yugoslavia shifted more and more to Tito and his forces. They fought during the whole time against the German invaders with varying success, mostly supported by small British forces on land and by the British navy in the Adriatic, as well as by Allied air forces from Italy. The advance of the Russian army through Rumania marked a turning point, as did Bulgaria's desertion of the German alliance; Russian and

Yugoslav representatives at their desks before the new republic's first regular parliamentary session opened at Belgrade in May 1946

Yugoslav forces combined in the liberation of Belgrade and of the eastern parts of Yugoslavia, while the Bulgarian army began to collaborate with the Yugoslavs. By the end of 1944 much of Yugoslavia had been liberated. Tito was able to establish his administration on firm foundations. On Jan. 2, 1945, King Peter agreed to the formation of a regency, an act which definitely confirmed the abdication of the monarchy in favour of the movement led by Tito.

A coalition cabinet was established in Belgrade in March, 1945. Of its 28 members, 6 represented the London government. The two most prominent of these were Shubashitch, who became minister of foreign affairs, and Milan Grol, a Serb democrat. But all the power remained in the hands of Marshal Tito and other members of the Communist party. The secret police, the O.Z.N.A. (Odelenje Zastite Narod—Department of Defense of the People), was responsible for the maintenance of order and of the "right spirit." By the end of the summer Dr. Shubashitch and Dr. Grol had resigned from the cabinet.

Russian Ascendancy.—On April 11, 1945, Yugoslavia concluded a 20-yr. treaty with the U.S.S.R. Yugoslav policy was conducted throughout 1945 and 1946 in complete agreement with Russian policy. The huge Yugoslav army was not demobilized. Very much in the country had been destroyed and the economic and transportation situation suffered heavily from losses inflicted by the German-Italian occupation. The government evolved far-reaching plans for the improvement of economic conditions of the country and with great energy went after their realization.

Meanwhile, the nationality problem which had afflicted Yugoslavia for 20 years led to the formation of a federation in which the various nationalities and regions were put on an equal basis. Yugoslavia was divided into six federal states, Bosnia-Hercegovina, Croatia, Macedonia, Montenegro, Serbia and Slovenia, each with its own administration, but united through the direction by Communist party members. The Croatian Peasant party which represented the overwhelming majority of the Croats was in opposition; its famous leader, Dr. Machek, went into exile. In Macedonia, Macedonian was recognized as a separate Slav language and was made the official language of south Serbia. A special alphabet was evolved for the new

language. The creation of this new national Macedonia was to serve as a centre of attraction for Greek and Bulgarian Macedonia, which was coveted by Yugoslavia. The ministry of national education in Skoplje, the capital of the new Macedonia, published on July 1, 1945, the first issue of *Prosvetno Delo* in the new alphabet, the central Macedonian dialect being used as the new literary language.

On Nov. 11, 1945, elections were held for the constituent assembly. Only candidates of Marshal Tito's Liberation front which formed the government, presented themselves. The electorate voted overwhelmingly for the single list of candidates. On Nov. 29 the constituent assembly proclaimed the federal People's Republic of Yugoslavia and abolished the monarchy. King Peter protested this act as a violation of the agreement concluded between Shubashitch and Tito in June 1944 under guarantees of the Allies, and charged that a totalitarian tyranny reigned in Yugoslavia.

International complications were caused by Yugoslavia's demands for territory from Austria and Italy. When Germany collapsed, Marshal Tito's forces occupied the Italian province of Venezia Giulia and the Austrian province of Carinthia, claiming these lands as inhabited by Yugoslavs (Slovenes and Croats). After protracted controversies the Yugoslav armies abandoned the Austrian territory, and the decision regarding its sovereignty was left to the peace conference. As regards the Italian territory, the justice of Yugoslav claims to a large part of it was generally recognized on ethnographic grounds, and all the districts with an undisputed Yugoslav majority were put under Marshal Tito's administration. The remaining much smaller part

which, however, included the important port of Trieste, was left under Allied administration until a final decision by the peace conference.

On Dec. 22, 1945, the British and the U.S. governments recognized the new "Federative People's Republic of Yugoslavia." According to the new constitution the praesidium of the constituent assembly, elected by both houses, was empowered, among other executive functions, to represent the new state inside and outside the country. President of the praesidium was Ivan Ribar, a Croat lawyer; the six vice-presidents were Mosha Pijade, a Jewish Serb journalist and secretary of the Communist party; Philip Lakus, a former deputy of the Croat Peasant party; Dr. Josip Rus, a Slovene liberal and a judge by profession; Djure Pucar, a Bosnian Serb; Dimiter Vlahov, a Macedonian communist; and Marko Vujachitch, an agrarian from Montenegro.

At the time of the recognition of Marshal Tito's government, U.S. Acting Secretary of State Dean Acheson made public the instructions sent to U.S. Ambassador R. C. Patterson, Jr., in Belgrade, declaring that in view of conditions existing in Yugoslavia, it could not be said that the guarantees of personal freedom and of liberties of speech, press and assembly, promised in the Tito-Shubashitch agreement and underlying the Yalta declaration, had been honoured. Nor did the elections of Nov. 11, 1945, provide, in the opinion of the U.S. government, an opportunity for a free choice of the people's representatives. Under those circumstances the U.S. government warned that the establishment of diplomatic relations with the regime in Yugoslavia "should not be interpreted as implying approval of the policies of the regime, its methods of assuming control or its failure to implement the guarantees of personal freedom promised its people."

On March 24, 1946, the Yugoslav government announced that General Mikhailovitch had been taken a prisoner on March 13 and would face trial for treason. The U.S. government requested permission for American army personnel connected with General Mikhailovitch during the war to testify at his trial. The Yugoslav government rejected this request. Mikhailovitch was found guilty on July 15 and was executed two days later. On May 9, the first anniversary of the victory over Germany, a huge military parade was held. Many types of heavy Russian tanks and much motorized artillery were on display. On the same day a mutual assistance pact between Yugoslavia and Czechoslovakia was signed and the brotherhood of the two Slav peoples was emphasized.

788 Yukon Territory

Popularly called "the Yukon" by Canadians, Yukon Territory is the most westerly political division of the Dominion of Canada. Slightly more than one-half the size of the province of Ontario, the territory's 207,076 sq.mi. (of which 1,730 sq.mi. are fresh water) are bounded on the north by the Arctic ocean, the east by the Northwest Territories, the south by British Columbia and Alaska, the west by Alaska. Capital is Dawson, other centres of population being White Horse, Mayo and Carcross. English is the chief language, and the population is predominantly Anglican.

World War II speeded the rate of population increase; at one time during the building of the Alaska highway and the Canol project, the population of the Yukon went over the 10,000 mark. But this was only temporary, and in 1945 the majority of the military personnel was withdrawn. Nevertheless, the permanent population in the 1941 census reported growth to 4,914, and in 1944 the dominion bureau of statistics officially estimated the population to be not less than 5,000.

The Yukon, formerly part of the Northwest Territories, was made a separate territory in 1898, with a local government of an appointed controller and three legislative council members elected for three years. Elections during the 1937-46 decade were held in 1938, 1941 and 1944. Controller for the same period was George Allen Jeckell.

During the first part of the 1937-46 decade, the Yukon followed pretty much its well-established economic trends. Placer gold-mining, using electrically-powered hydraulic equipment, was the largest single activity, with lumbering, fishing and fur trading far behind. There were also important consolidations within the placer mining activity. By 1937 only a few individual miners operating pick and shovel and cradle remained: mechanization had replaced the romantic methods of the big gold rush. By 1946 this mechanization, with its demands for electric power, had resulted in a modest expansion of the hydroelectric potentials of the territory.

When World War II cut the usual lines of supply for scarce raw materials, there was widespread search for new sources, and deposits of Yukon scheelite, from which vital tungsten was extracted, were exploited, bringing a flurry of activity to various regions. But the territory was not greatly affected by the war until Japan attacked the U.S. and brought Alaska into the orbit of military strategy. The initiation of joint Canadian-U.S. defense projects in 1942 was followed by a period of great activity.

Work on the Alaska highway commenced in March 1942, and construction of 1,523 mi. of road from Dawson Creek, B.C., to Fairbanks, Alaska, was rushed forward. Of this distance, 1,220 mi. were constructed in Canada, including 560 in the Yukon. The highway was completed as a pioneer road in Nov. 1942, with many of the bridges only temporary wooden structures. During 1943 the highway was developed until it met the standard requirements of a gravelled military route. Steel bridges were prefabricated in sections in Edmonton, Calgary and Winnipeg; shipped to railhead, and transported to river sites on special trucks. In addition, a cut-off road was constructed from Haines, Alaska, on Lynn canal, to meet the highway about 95 mi. west of White Horse. This route, 154 mi. in length, was completed late in 1943. Access roads, totalling more than 200 mi., were constructed to link airports and intermediate aerodromes along the Northwest Staging route with the Alaska highway.

Travel on the Alaska highway and connecting roads was restricted and controlled by the Joint Traffic Control board, set up in 1943 with headquarters at Edmonton. On April 3, 1946, however, Canada took over the jurisdiction of the Alaska highway, and immediately began to build numerous refuelling depots, comfort stations and accommodation camps, anticipating removal of tourist travel restrictions over the great scenic route.

In 1946, also, Canada took over jurisdiction of the Edmonton to Alaska section of the telephone system which the U.S. military authorities had set up along the Alaska highway. This provided an important communications link between the Yukon and the rest of Canada, supplementing the department of national defense radio stations operated at Dawson, White Horse and Mayo.

Major world aviation developments during the decade brought the Yukon to the fore. An early defense project of World War II was the so-called Northwest Staging route, which was a series of military airports connecting Edmonton and U.S. defense installations along the Alaska coast. North America-Asia commercial routes began circling the top of the globe in 1946, and the military flight strips constructed during the war along the Alaska highway and the staging route aerodromes became part of the emergency landing system established between principal commercial airports.

Probably the most spectacular war development affecting the Yukon was the effort to make the northwest corner of North America self-sufficient in gasoline in case the coast should be attacked and occupied by Japanese forces. On March 31, 1944, the Canol project, being a 600-mi. pipe line pumping oil from Norman wells, Northwest Territories, across the Mackenzie mountains to White Horse, was completed; and the following May a White Horse oil refinery began operating. But this hope of industrial expansion faded when in March, 1945, the pumping of oil from Norman wells was discontinued, and the operation of the refinery suspended. (C. CY.)

Zeitzler, Kurt

Zeitzler (1895-), German army officer, was born in Luckau, Brandenburg, Germany. He joined the army in World War I, serving as infantry lieutenant, and gave up his commission after the Armistice in 1918. Rejoining the Reichswehr in 1926 as a captain, he rose through the grades, becoming a major general in early 1942 and then a full general. Zeitzler commanded an infantry unit during the Polish campaign (Sept. 1939), and was chief of staff to Gen. Paul L. von Kleist in the French campaign (May-June, 1940). Later he was assigned as chief of staff to Marshal Karl R. von Runstedt, when the latter was commander of German armies in the west in 1942. In the winter of 1942, Zeitzler, who was virtually unknown outside Germany, was made chief of the German general staff, replacing Gen. Franz Halder. On Jan. 31, 1944, Hitler promoted Zeitzler to the rank of colonel general; the following March, he was replaced by Gen. Alfred Jodl as chief of the army general staff.

Zhdanov, Andrei Alexandrovich

Zhdanov (1896-), soviet politician, was the son of a Russian Orthodox clergyman. He fought in the Russian imperial army as a noncommissioned officer and at the outbreak of the revolution in 1917 urged soldiers to join the bolshevists. He enrolled in the Communist party and was party secretary in the industrial city of Gorki. After the assassination of Sergei Kirov in 1934, Zhdanov became party leader for Leningrad. That same year, he was also elected to the politburo of the Communist party and was named by Stalin as an alternate party secretary. In 1937, he was elected to the supreme soviet, and the following year he became head of the foreign affairs committee in the soviet of the union (lower house of the soviet parliament). Later, he was elected president of the R.S.F.S.R. (Russian republic).

During the German attack on Leningrad, Zhdanov was appointed head of the Leningrad Military council with the rank of major general. He was credited by many sources as having organized the successful defense of the city, and he signed the soviet-Finnish armistice in 1944. He was made chairman of the Allied control commission for Finland, and resigned as Leningrad party secretary to devote more of his time to his new post. In 1945 and 1946, rumour was current in Moscow that Zhdanov was Stalin's first choice as his successor. Zhdanov was elected (March 12, 1946) as chairman of the soviet of the union.

Zhukov, Georgi Konstantinovich

Zhukov (1895—), soviet army officer, was born in 1895 in the village of Strelkova, central Russia. He left school at an early age, and was inducted into the Russian imperial army in 1915. After the revolution in 1917, he enlisted in a Red Guards cavalry division, joined the Communist party in 1919 and fought in the civil war. He continued in the army after the bolshevist victory, studied at the Frunze Military academy, attended German general staff lectures in Berlin and was soviet military observer in the Spanish Civil War.

In 1939, Zhukov led Red army tank units that surrounded and destroyed the 6th Japanese army in the fight-

ing along the Mongolian-Manchurian border. During the Russo-Finnish war of 1939-40, he served on Semyon K. Timoshenko's staff and in Feb. 1941, he was appointed chief of the army general staff, vice-commissar for defense, and alternate member of the Central committee of the Communist party.

After the German invasion of the U.S.S.R., Zhukov was made commander of the western front army, with the special task of defending Moscow in Oct. 1941. Zhukov's counteroffensive, launched Dec. 6, turned back the Germans from the capital. In Aug. 1942, Zhukov was made first vice-commissar for defense and directed the defense of Stalingrad as well as the counteroffensive that drove the Germans from the Don-Volga area.

Zhukov was then sent to the Leningrad front, where he co-ordinated the soviet operations which resulted in lifting the siege of the city on Jan. 18, 1943. Two days later he was promoted to the rank of marshal of the soviet union.

He participated in the soviet summer offensive of 1943 and in March 1944, took command of the 1st Ukrainian army, launching a drive that went through Poland to the borders of Czechoslovakia. On April 10, 1944, Zhukov received the Order of Victory, the highest award of the soviet union, and in July he returned to Moscow to act as Stalin's deputy commander in chief. In this capacity he co-ordinated the strategy of the numerous soviet armies in the field.

In early Jan. 1945, when his plans for invasion of Germany were completed, he left his desk job to lead the 1st White Russian army in the drive on Berlin. The offensive, launched Jan. 12, 1945, by five large armies, was successful. Berlin fell to soviet forces May 2, and Zhukov headed the Allied delegation that accepted the German surrender in the ruined city, May 8, 1945.

Zhukov was then appointed head of the soviet occupation forces in the reich, and after the merger of the soviet armed forces (announced on March 22, 1946), he was made commander of soviet ground forces. Thereafter, his star apparently declined. On April 10, 1946, he relinquished his post as soviet occupation chief in Germany, and on Nov. 18, 1946, it was disclosed that he had been succeeded as commander of ground forces by Marshal Ivan Stepanovich Konev.

Zinc

World production of zinc continued to be concentrated in a relatively few countries during the decade 1937-46, so far as major producers were concerned. While there were a few other small producers, 99% of the world output was accounted for by the countries listed in Table I. However, attention should be called to the fact that this is a table of smelter output, and not mine output; the latter would be dispersed a little more widely. There were a number of gaps in the table during the war years, and it was impossible to arrive at a reliable figure for the world total after 1940. The totals shown in parentheses in the table are rough approximations, based on the year-to-year changes in the figures reported, and so include the assumption that over-all changes in other countries were in the same proportion. While there were certainly some variations from this assumption, the reporting countries represented about 85% of the total, and variations of the estimates from the true totals should not be great.

Zinc differed from other metals in that a larger proportion of its smelting capacity was in the active war zones than was the case with any other major metal. However,

since much of this capacity normally used a large proportion of imported ores (most of which originated from without the war zones), smelter output in the war zones was cut sharply through lack of ore supplies, when war conditions stopped importation of ores. Conversely, ores that normally would have gone to these areas were diverted to other smelting centres, especially the U.S. While there was much shifting of ore supplies from one country to another, the production trend seemed to have been continuously upward from 1937 to 1943, except for 1938, followed by moderate declines in 1944 and 1945, after the peak of war demand had been passed.

United States.—Mine production of zinc in the U.S. suffered a 1700 decline in the recession year 1938, from which it had not recovered in 1939. Production continued to respond to the increasing war demand that followed, up to 1942, with declines in the following years, the total for 1945 being less than for 1937. Demand far exceeded the domestic supply, which was supplemented by imports, both of ore and metal. Smelter output from domestic and foreign ores reached a peak in 1943, but the subsequent decline was relatively much less than with mine output, because of greater imports of ore.

Prewar imports were negligibly small, but expanded rapidly from 1940, reaching a maximum in 1943, when the zinc content of ore imported was 73% of the domestic mine output.

The chief sources of ore imports were Australia, Canada and Mexico. Metal imports increased moderately, mostly from Canada and Mexico.

Consumption of zinc continued to increase up to 1944, and showed only a 4% decrease in 1945.

The decline in domestic mine production, under way since 1942, continued into 1946, though with some improvement after midyear, bringing the Oct. 1946 output

back to the average rate ior 1945. The total for the 10 mo. was 470,218 short tons, equivalent to an annual rate of 564,300 tons, or 8% less than in 1945. Smelter output in the first three quarters of 1946 was 568,802 tons, and consumption was 563,394 tons. Imports continued the 1945 trend, with ore decreasing and metal increasing.

Canada.—In addition to the metal output shown in Table I, Canada exported a large percentage of the mine output as concentrates. Total mine production increased from 185,169 short tons in 1937 to 305,377 tons in 1943, and decreased to 254,815 tons in 1945 and 235,917 tons in 1946, 9% less than in 1945.

Zionism

At the beginning of 1937, the Jewish population of Palestine numbered 404,000, or 30.6% of the total settled population. Of this number, no fewer than 144,000 had entered during the previous four years, for the most part from nazi Germany and from Poland. In the period which followed, as one country after another succumbed to the nazis, the situation of the Jews in Europe continued rapidly to deteriorate, with a corresponding increase in the pressure to emigrate. Nevertheless, political developments within Palestine itself resulted in a relative contraction in the rate of Jewish immigration into that country, though a steady stream of immigrants continued to arrive even during World War II. In all, during the decade ending in Dec. 1946, 104,000 additional registered immigrants entered Palestine. At the latter date the estimated Jewish population of Palestine totalled approximately 620,000, or 32% of the whole.

At the end of the decade, land in Jewish ownership in Palestine amounted to approximately 687.5 sq.mi. out of Palestine's total area of 10,100 sq.mi., an increase during the ten years of approximately 156 sq.mi. More than 100 new Jewish settlements were established in this period, bringing the total number of such settlements to 320 scattered throughout Palestine. Despite increasing legislative and other difficulties, land purchases by Jews and Jewish organizations continued to be made on the open market though, generally, at highly inflated prices.

About 45% of all Jewish-owned land at the end of 1946 belonged to the Jewish National fund (a public body leasing land to settlers for 49 yrs., with a renewal option for a similar period). During the period 1936–46 the population settled on Jewish National fund land more than doubled, from a figure of 44,200 to more than 100,000. With other

Jewish bodies, the fund invested large sums in drainage, afforestation and in otherwise ameliorating the land.

Jewish urban development also showed marked advances. As compared with the 1936 figure, the Jewish population of Jerusalem had increased in 1944 by 30% to a total of 97,000, while Haifa, with a Jewish population of 66,000, had recorded a 20% increase in the same period. The growth of the all-Jewish city of Tel-Aviv was even more striking; founded in 1909 and proclaimed a municipal corporation in 1932, its estimated population in 1946 was 208,000, an increase of about 40% more than in 1936.

Particularly impressive were the developments in the character and scope of Palestinian industry. The economy of Palestine had within a few years been transformed from a predominantly agricultural into that of a semi-industrialized country. This development was associated with the immigration into Palestine from central and eastern Europe of large numbers of manufacturers, skilled workers and experts of various kinds. It was greatly accelerated by World War II when, as the only territory in the middle east with a considerable reservoir of technically trained personnel, Palestine became an important centre of production for the war effort. The effect of war conditions, further, was for the time being to create in Palestine itself a highly protected market at a time of severe shortage of consumer goods. While this resulted in a considerable measure of inflation, it also stimulated the development of a remarkable variety of new industries, many of which would appear to have good prospects to establish themselves firmly and to survive the change-over to peace conditions. The number of workers employed in Jewish industry and handicrafts increased from 33,000 in 1935 to 66,000 in 1945, while the value of manufactured goods produced in the same period rose from £9,000,000 (\$36,000,000) to a total of £50,000,000 (\$200,000,000).

Decade of Disorder.—The decade 1937–46 was one of almost uninterrupted tension and difficulty for the Zionist movement. Reflecting faithfully the deterioration in the general international situation, events in Palestine had taken an ominous turn for the worse early in 1936 following Mussolini's successful invasion of Abyssinia. Violent disturbances broke out in Palestine which lasted for the better part of three years. During this period 134 British, 462 Jews and 1,082 Arabs were killed; in addition, considerable numbers from among Arab terrorist gangs were killed by military and police action.

The reaction of the Zionist leadership was to organize resistance to the terrorists by all means at their disposal but, at the same time, firmly to reject a policy of indiscriminate retaliation by killing innocent Arabs in revenge for the murder of innocent Jews. Despite great provocation, this self-imposed policy of self-restraint was, with few exceptions, rigorously observed.

In the winter of 1936-37, a British royal commission, under the chairmanship of Lord Peel, was sent to Palestine to inquire into the situation and to make recommendations. In its report, issued in July 1937, the commission stated that "unquestionably... the primary purpose of the Mandate as expressed in its Preamble and Articles is to promote the establishment of the Jewish National Home." Nevertheless, adopting a broad view of its terms of reference, it expressed the opinion that the irreconcilable aims of Arabs and Jews in Palestine had made the mandate unworkable and that it should be abrogated. The commission therefore recommended the partition of Palestine and the setting up of independent Jewish and Arab states.

The partition proposal created deep differences of opin-

ion among Zionists throughout the world. It was realized that a turning point had been reached in the relations of the Jews and the mandatory power. But there were many who, on historical, religious and economic grounds, were strongly opposed to what was regarded as a further partition of the area of the Jewish national home, the first having taken place in 1922, with the political separation of Trans-Jordan from western Palestine. On the other hand, there were those, led by Dr. Chaim Weizmann, president of the Jewish Agency for Palestine and of the World Zionist organization, who saw in the early prospect of Jewish statehood, even though in a relatively small area, the best hope for rescuing large numbers of their fellow Jews from the impending calamity and at the same time achieving that national status for the Jewish people in Palestine which was fundamental to the Zionist idea.

By a majority of nearly two to one the Zionist congress, which met in Zurich, Switzerland, in the summer of 1937, adopted a resolution which, while rejecting the plan of partition proposed by the Peel commission, nevertheless authorized the Zionist executive to negotiate with the British government. However, despite its own announced acceptance of the royal commission's proposal, the British government postponed action and finally, with the sending out a year later of a new commission, the proposal was abandoned. Instead, there followed early in 1939 the London conferences, held at St. James's palace, between representatives of the British government on the one hand and of Jews and Arabs, respectively, on the other, which culminated finally in the White Paper of 1939.

White Paper of 1939.—The crux of the problem was obviously immigration. Ever since the confirmation of the mandate in 1922 the criterion by which the biannual immigration quotas had been determined by the Palestine government was Palestine's economic capacity to absorb additional immigrants. As had been stated in the letter from the prime minister to Dr. Weizmann, in 1931, that was the sole limitation admissible in terms of the mandate, and this position had been confirmed by the Permanent Mandates commission and the council of the League.

The 1939 White Paper proposed to abandon this criterion and, after providing for the admission within a five-year period of an additional 75,000 immigrants, to put a stop to all further Jewish immigration into Palestine except with the acquiescence of the Arabs. Moreover, Jewish settlement and land development in Palestine was to be severely curtailed as a result of provisions designed to restrict Jewish purchase of land to an area of 500 sq.mi., approximately 5% of the total area of Palestine west of the Jordan. For this policy the government obtained approval in parliament by the relatively small majority of 268 votes (as against its usual voting strength of 413) to 181.

Jewish reaction to the White Paper was one of bitter disillusionment. The proposals were condemned as a betrayal and as calculated to lead to the liquidation of the Jewish national home. In Palestine itself there were sporadic disorders, and the leadership of the Jewish agency made it clear that it would seek, whatever the obstacles, to bring Jewish immigrants into Palestine and to extend Jewish agricultural colonization. Among those who criticized the White Paper were Winston Churchill, Herbert Morrison and other leading members of parliament.

In Aug. 1939 the Permanent Mandates commission of the League of Nations, having exhaustively considered the issues involved, expressed the unanimous opinion that the policy of the White Paper was not in accordance with the

interpretation of the mandate agreed upon by the council of the League, the Permanent Mandates commission and the mandatory power.

Before the matter could be considered by the council of the League of Nations, World War II broke out. Dr. Weizmann, in a letter to Prime Minister Neville Chamberlain, dated Sept. 1, 1939, immediately offered the assurance that the Jewish agency wished its differences with the mandatory to give way before "the greater and more pressing necessities of the time"; and he pledged Jewish manpower, technical ability and economic resources to the cause of the world democracies. In Palestine a Jewish national register of volunteers was opened, and more than 134,000 Jews between the ages of 18 and 50 expressed their readiness to volunteer for immediate service, for the most part in a combatant capacity. It was not until some time later, however, that under stress of war needs Jewish volunteers from Palestine began to be accepted in small scattered Jewish units of the British army. And finally, late in 1944, the British government announced the formation of the Jewish brigade group which, as part of the 8th army, participated in the fighting in Italy. In all, about 30,000 Jewish volunteers from Palestine served in the British forces during the war, a creditable record in the light of a total population of 600,000.

Biltmore Program.—A major development in Zionist policy during World War II was the adoption of the so-called Biltmore program in favour of the establishment of Palestine as a Jewish commonwealth. The program was first formulated at a conference of American Zionists held in New York in May 1942. It was formally endorsed a few months later on behalf of the whole movement, by the Inner Zionist General council in Jerusalem and by the World Zionist conference held in London in Aug. 1945. The first postwar congress of the World Zionist organization, held in Basle, Switzerland, in Dec. 1946, also confirmed this formulation.

The significance of this development lay in the fact that formerly the Zionist organization had studiously refrained from defining the aims of the movement in final terms. As long as Jewish immigration and land settlement could proceed uninterruptedly within the framework of the mandate, it was felt that such a definition would be premature and might be harmful. The White Paper of 1939, however, with its far-reaching restrictions on further Jewish immigration and land settlement made it imperative, in the view of the Zionist leaders, that Zionist aims be defined in clear and authoritative terms. It was urged that the gates of Palestine be opened to Jewish immigration; that the Jewish agency be vested with the control of immigration into Palestine and with the necessary authority for the upbuilding of the country and that Palestine be established as a Jewish commonwealth integrated in the structure of the democratic world and based upon full equality of rights for all its inhabitants without distinction of religion or race.

Deterioration in Palestine.—The end of World War II in Europe revealed the terrible fate which had befallen European Jewry at the hands of the nazis. Of the 7,500,000 Jews of Europe (outside the soviet union) 6,000,000 had perished in the most barbarous mass slaughter in history. The condition of the survivors, many of whom remained herded in "displaced persons" camps, was in general of the most miserable description. The reports of successive investigators made it clear that for many of them the prospects were slender of an early integration into the

economic and social life of the countries where they had lived. Hundreds of thousands wished, above all, to emigrate, the great majority of them to Palestine.

As the full horror of what had happened in Europe became known, the demand that the White Paper be abrogated and the surviving Jews of Europe allowed freely to enter Palestine gathered momentum. Palestine Jewry made it clear that it was united in its determination to do whatever lay in its power to give succour to the tragic remnant of its brethren. As successive transports of would-be immigrants arrived off the shores of Palestine and sought to break through the British air and naval blockade of the Palestinian coast, tension mounted to a dangerous pitch. In the case of the extremist Jewish groups, resistance began to assume the form of terrorist outrages directed against the British authorities who, in turn, sought by repressive measures to stem the growing agitation.

Hopes that the new Labour administration of Prime Minister Clement Attlee would, in fulfilment of the policy set out in its party platform, repudiate the White Paper and take positive action in behalf of the immediate entry of large numbers of Jews into Palestine, were disappointed. The Palestinian administration continued severely to restrict the grant of immigration certificates and the discriminatory land regulations remained unchanged.

In the meantime, the growing interest of the United States in the related issues of Palestine and the Jewish survivors in Europe had become an important factor in the situation. On Sept. 2, 1945, Pres. Harry Truman sent a personal letter to Prime Minister Attlee, urging the admission of 100,000 Jewish refugees into Palestine. This request was not granted, but in November it was announced that a joint Anglo-U.S. committee of inquiry would be set up "to examine the question of European Jewry and to make a further review of the Palestine problem in the light of that examination." The report of the joint committee, issued at the end of April 1946, recommended inter alia the immediate entry of 100,000 Jewish displaced persons from the camps in Europe and the virtual abrogation of the White Paper of 1939. On the question of larger policy, the committee declared that Palestine should be neither a Jewish state nor an Arab state and recommended that for the time being the existing mandate be continued "pending the execution of a Trusteeship Agreement under the United Nations."

President Truman immediately indicated his approval of the recommendation of the committee for the transfer of the 100,000 Jews to Palestine, but the British government again delayed action. Instead, a new joint committee was set up, which, though ostensibly appointed to give effect to the recommendations of the earlier body, in fact put forward entirely new proposals for the division of Palestine, apart from the Negev, into semiautonomous Jewish and Arab provinces under the ultimate control of a central British administration in Jerusalem. In outlining this plan to parliament on July 31, 1946, Herbert Morrison announced that the British government proposed to submit it as a basis for negotiation to a conference of representative Jews and Arabs which would be convened in the near future in London.

The Morrison plan was acceptable neither to Jews nor to Arabs. It was condemned by the Zionist leaders both because of the very small area, 15% of western Palestine, which it was proposed to allocate to the Jewish province and also as having all the disadvantages without any of the advantages of partition.

The situation in Palestine in the meantime continued to deteriorate. The government's failure to implement the

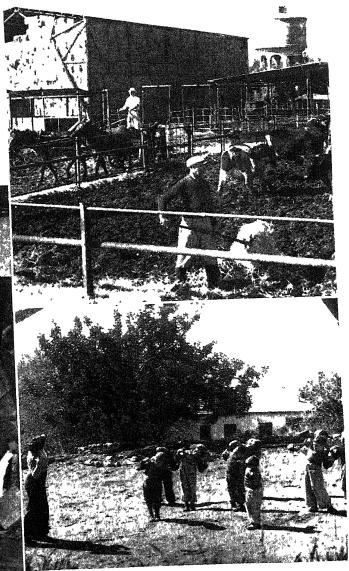

Above: Tiny fortress-like settlement of Gouloth erected in primitive fashion in 1946 on land purchased from Arabs in the Negev desert area when such purchases by Jews were still legal

Right: Agricultural workers on a Jewish farm settlement in Palestine. There were 320 such communities in the Holy Land in 1946

Lower Right: Calisthenics class for children of Jewish settlers in Palestine. Child care was a prime consideration in the autonomous social order followed in these settlements

Below: Young Zionists assigned to work in the hatchery on their communally worked farm. Most Jewish settlements aimed at self-sufficiency in supplying their own food requirements

recommendations of the Anglo-U.S. committee in regard to immigration and the abrogation of the land restrictions had further embittered Palestine Jewry and strengthened the hands of the terrorists. Nor were matters improved by the arrest and detention for months without trial of several of the leading members of the Jewish agency.

In Aug. 1946 the Jewish agency executive, apart from those members still under detention, met in Paris. It rejected the Morrison plan as a basis for discussion, but in an effort to break the impasse expressed its readiness to negotiate a proposal for the establishment "of a viable Jewish State in an adequate area of Palestine." In a statement dated Oct. 4, 1946, President Truman indicated that a solution along these lines would have the support of the U.S. government. Informal conversations which followed between the British foreign and colonial secretaries on the one hand, and representatives of the Jewish agency on the other, were inconclusive, and the question of Jewish participation in the London conference was finally deferred until after the 22nd Zionist congress scheduled to be held in Basle in Dec. 1946.

The Basle congress was the first congress of the World Zionist organization held in seven years. Its composition reflected the change in the structure of the Jewish people brought about by the destruction of many of the great Jewish communities of central and eastern Europe and the consequent increase in the influence and authority of the U.S. segment of world Jewry. Disillusionment with a policy which looked to an arrangement with Great Britain was shown in the failure of congress to re-elect the veteran and distinguished leader of the Zionist movement, Dr. Chaim Weizmann, to the position of president of the organization which he had occupied practically since the time of the Balfour declaration. No other president, however, was elected in his stead. After prolonged, and, at times, stormy discussions, it was resolved by a small majority not to participate in the London conference "in the existing circumstances." At the same time, authority was given to the general council of the Zionist organization to determine the conditions under which the Zionists would be ready to participate. Twenty-nine years had passed since the Balfour declaration. The character of the partnership which for most of that period had existed between the Jewish people and Britain in regard to the Jewish national home and Palestine was apparently about to enter a new phase. Zirconium

For the first time the production of zircon in the United States attained significant proportions during the decade 1937-46. A war-born project for recovery of the zircon content of Florida beach sands delivered several thousand tons of concentrates to consumers in 1945, and in the first half of 1946 domestic production was about on a par with imports in supplying the demand.

U.S. Imports of Zircon and Baddleyite, 1940-45

(In short tons)													
								Zîr	rcon from	1	Total	Baddleyite	Total
								Australia	India	Brazil	Zircon	from Brazil	Imports
1939								1,526	241	*	1,767	706	2,473

*Included with baddleyite.													

Previously, U.S. supplies had been furnished by imports, as indicated in the accompanying table.

Shipments of domestic and imported concentrates to consumers reached a record high of 16,000 tons in 1945, one-fifth of which was used in the production of zirconium ferrosilicon and other alloys, and the remainder in ceramics, mainly porcelains and refractories. In the first half of 1946 shipments to consumers increased to 8,600 tons, but imports declined to 5,208 tons. (G. A. Ro.)

Zog I

King Zog of Albania (1895—) was born Oct. 8. Educated at a Monastir military school and at the Turkish Lycée in Constantinople, he fought with the Austrians in World War I. After the armistice, he became minister of the interior, retaining this office from Jan. to Nov. 1920 and organized Albanian resistance to Yugoslav raids. The following year, he was made commander in chief of the Albanian forces. Returning to the interior ministry, he suppressed a revolt in early 1922.

Zog became prime minister in Dec. 1922 but resigned after an attempt against his life in Feb. 1924 and fled to Yugoslavia. Returning to his homeland, he regained power, was elected president of the Albanian republic, Feb. 1, 1925, and was proclaimed king of Albania, Sept. 1, 1928.

He married Countess Geraldine Apponyi of Hungary on April 27, 1938. A son, Prince Skander, was born to them April 5, 1939. Three days later the Italians invaded Albania and the royal family fled to Greece. Later, they went to France where they were forced into flight to England by the German invasion in 1940. Zog then moved to Alexandria, Egypt. While he frequently expressed the conviction that the Albanian people would re-establish the throne, his hopes were dashed by the establishment of a republic, Jan. 11, 1946, by the Albanian constituent assembly.

Zoology

At the beginning of the decade 1937-46, zoological research was exhibiting its most rapid advances in the fields of genetics and experimental embryology. From these main currents of research, however, several important new

streams of investigation were taking form. A few of these may be thought of as branches separating from their parent streams to assume a relative independence, but others took their origin from the confluence of the main currents and these latter, providing an important integration between previously widely separated fields, were strengthening rapidly at the beginning of the decade and showed promise of results of broad significance.

With the exigencies of World War II the course of zoology, like that of every science, was necessarily altered. Fortunately most of the chief lines of investigation did continue some advance, but much of the work in fundamental zoology was, perforce, suspended. The attention of many workers in the field was turned to subjects of more immediate practical importance. As a result, certain of the problems which seemed destined for rapid solution remained unanswered, and the rate of advance in some lines was considerably decreased. On the other hand, certain fields of zoological research which had previously been somewhat neglected took great strides forward during World War II. For obvious reasons such subjects as parasitology, entomology (both in relation to agriculture and to insect-borne diseases) and animal husbandry were intensively studied and greatly advanced. Moreover, certain techniques and materials developed as a result of war research influenced the course of zoological investigation by providing tools previously unknown or unavailable. The most noteworthy example of this was the use of radioactive tracers in physiological studies, a technique which came into wide use with the increased production of radioactive isotopes by the numerous cyclotrons employed in researches in nuclear physics. Finally it may be mentioned that knowledge of the geographical distribution of many plants and animals was increased by the spread of troops into isolated and little-known regions. This was particularly true with reference to the smaller islands of the Pacific. Interested naturalists, both professional and amateur, took advantage of whatever opportunities for collecting they were afforded in these out-of-the-way parts of the world, and a number of important additions to the fauna and flora of the Pacific thus found their way into museums, to be of value in future studies.

Embryology.-The initiation of embryonic development, the process of fertilization, was rather intensively studied from a chemical point of view during the decade. The work of R. Kuhn, F. Moewus and D. Jerchel (1938), demonstrating that the fusion of the male and female gametes of the alga Chlamydomonas is brought about through the mutual attraction exerted by specific chemical substances secreted by the two gametes, aroused interest in similar substances in animal eggs. Earlier work on the sea-urchin egg led F. R. Lillie to advance the theory that it contains a substance which, upon passing into the surrounding water, causes agglutination of the spermatozoa of the same species. This substance he named fertilizin. M. Hartmann and O. Schartau (1939) showed that there are in fact two substances produced by the egg; one which activates and attracts the spermatozoa and another which causes agglutination. Kuhn and K. Wallenfels, working with a species found at Naples, identified the spermactivating principle as echinochrome. The agglutinating principle was investigated by Albert Tyler and his collaborators, who found it to be of protein nature. Tyler also studied substances produced by the sperm of marine invertebrates and found that the sperm elaborates a chemical which reacts with the agglutinating principle of the egg somewhat in the manner of antigen and antibody.

The traditional view that gastrulation in the bird is ac-

complished by a process of inturning at the posterior end of the blastodisc was controverted by several investigations. K. Peter, J. Pastells and W. Jacobson all found that the entoderm is formed by certain cells of the blastodisc giving rise to a new layer beneath the surface by a process which was variously termed "delamination," "polyproliferation" or "diffuse polyinyagination."

One of the most active fields in embryology during this period was that concerned with the study of morphogenetic stimuli. The pioneering work of Hans Spemann revealed that the primary organizer of the amphibian embryo lies in the roof of the archenteron. A chemical stimulus exerted by this tissue is responsible for the initiation of neural tube formation in the overlying ectoderm. J. Holtfreter showed that the presence of this organizer chemical can be demonstrated not only in the archenteron-roof but also in all other parts of the egg. The idea was advanced that the substance ordinarily exists in the form of some inactive precursor and is only liberated in tissue which passes over the dorsal lip of the blastopore. To test this hypothesis, several workers turned to studies of the metabolic characteristics of different parts of the egg. J. Brachet and H. Shapiro and F. G. Fischer and H. Hartwig reported a slight difference in oxygen consumption at the dorsal lip as compared with other parts of the egg but other workers failed to confirm this. Joseph Needham, E. J. Boell and V. Rogers, using the Linderstrom-Lang Cartesian diver technique, demonstrated that anaerobic glysolysis and anaerobic ammonia production are at much higher levels in the dorsal lip region than they are in ventral ectoderm. Transplantation of various chemical substances to regions beneath the ectoderm showed that many purified chemicals can cause neural tube formation if used in sufficiently high dosage but only a few are effective in minute doses. Needham interpreted this as meaning that the former substances act indirectly, by liberating the "masked" organizer-substance within the tissue itself, while only the latter may be considered as acting directly in a way similar to the natural organizer. On this basis, the primary organizer itself was considered to be a steroid, the most active substances found in these experiments being some of the polycyclic hydrocarbons such as methylcholanthrene, one of the powerful carcino-

Work on the development of the sea-urchin egg, somewhat paralleling that which led to the discovery of the organizer phenomenon in amphibians, was carried out by S. Horstadius and other workers in Sweden. It was found that in this egg, material from the animal pole causes production of ectodermal structures while material from the vegetal pole causes production of entodermal and mesenchymal structures. In normal development these two balance each other so as to give a normally proportioned larva, but by transplantation of one or the other of these materials into another egg the balance may be shifted so as to give, in the one case an "animalized" larva with abnormally large and abundant ectodermal parts and in the other case a "vegetalized" larva with overdeveloped gut and skeleton. Various chemical treatments can also shift the balance. Horstadius' interpretation of the situation was on the basis of a double gradient system, one gradient having its high point in the animal pole the other in the vegetal pole.

Studies on morphogenetic factors at stages after gastrulation were numerous and only a few can be mentioned. One of the noteworthy series of studies in this field was that of

F. R. Lillie and his co-workers, in which the regenerating feather germ of the bird was employed to elucidate problems of morphogenesis. As an example of experiments dealing with morphogenetic factors in invertebrates, the work of L. von Ubisch on the skeleton of the echinoderm may be noted. He found that the viscosity of the protoplasm is of importance in determining the nature of the skeletal spicules of the larva and that this is the basis for the variations in skeletal structures found in hybrids and chimeras. The inductive ability of the eye-cup in amphibia was studied by O. E. Schotté and F. C. Hummel, who found that when the eye lenses of adult salamanders are removed and replaced by regenerating tissue from the stumps of amputated limbs or tails, new lenses are formed by the regenerate under the organizing action of the eye cup. The regenerating tissue thus behaves like undifferentiated embryonic tissue.

The process of regeneration itself, which offers another experimental approach to the problem of differentiation, was investigated from several aspects. The source of the blastema cells in regenerating amphibian limbs and the inhibiting effects of X-rays on limb regeneration were studied by a number of workers. A. Striganova and several other Russian investigators added much to knowledge of the enzyme systems and the metabolic processes involved in the formation of the regeneration blastema. The role of the nerve supply in limb regeneration was studied by Schotté and E. G. Butler, who found that the nerve functions in stopping the regressive changes initiated at the time of amputation and thus makes possible the formation of the regeneration blastema. Study of regeneration in invertebrates centred about the problem of the function of gradient systems in determining the regenerative capacity at different levels along the axis. The Japanese investigator J. Watanabe found that eye-spot formation in the planarian occurs at different rates depending upon the level, the rate decreasing from anterior to posterior but rising somewhat near the tail. A. Goldin and L. G. Barth studied regeneration in a coelenterate, Tubularia, and obtained significant results showing that the polarity of the regenerate can be controlled by oxygen tension.

An extraordinarily rapid advance was made during the decade in knowledge of the origin and development of the pigment cells and the pigment patterns of vertebrates. F. Dorris showed, by means of explantation and transplantation experiments, that the pigment cells which give rise to the melanophores in the feathers of the bird, take their origin in the early embryo from the cells of the neural crest. M. E. Rawles successfully traced them to still earlier stages when they are localized in the surface of the blastoderm in the region of Hensen's node. The precise way in which the melanoblast cells migrate to reach their final position in the epidermis and the time required for this migration was studied by B. H. Willier and Rawles and by R. L. Watterson. Willier and his co-workers also investigated the origin of melanophores in regenerating feathers and found evidence that these are derived from a reserve supply of melanoblasts lying in the dermis. Since there are, in the domestic fowl, a great many colour varieties in which the colour pattern depends upon known genetic factors, work of this type offered an opportunity for analysis of the methods by which the genes control development to produce the characteristic adult structure. Willier and Rawles found that, in transplantation of ectoderm from one embryo to another of a different breed, the behaviour of the melanophore accords with its own genic

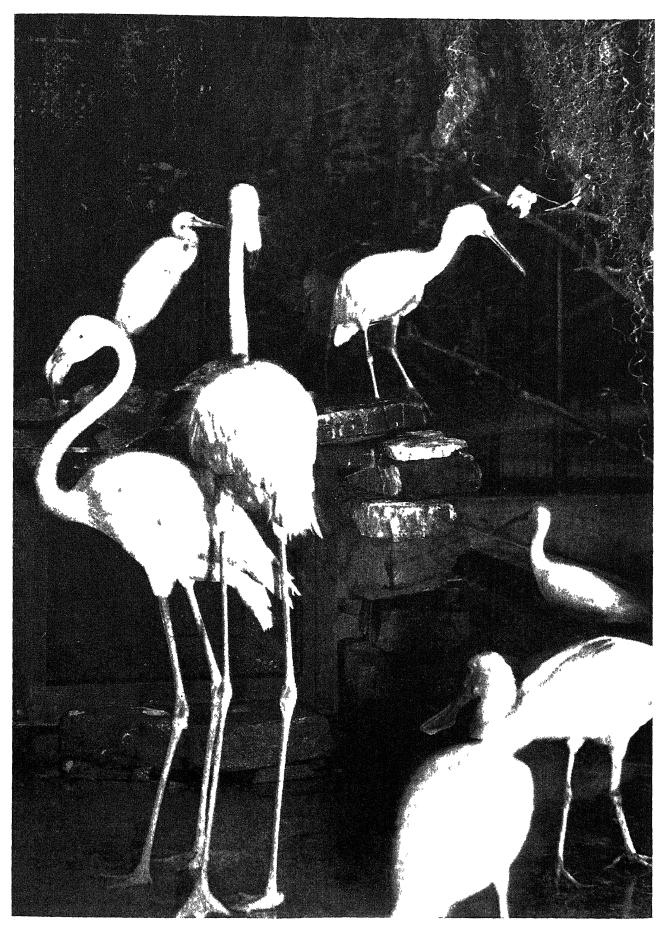

type regardless of the genic constitution of the feather germ which it supplies. Neural crest origin of skin melano phores in amphibians is also well substantiated and experiments by F. Baltzer at Berne showed that, when neural crest material is transplanted from frog to salamander larvae, the pigment cells retain the cellular characteristics of the donor but their arrangement is determined by the host pigment pattern.

Genetics.-The experimental study of gene mutations and chromosome aberrations continued to be a fruitful field of investigation, and the fundamental problem of the nature of gene mutation was attacked with a number of diverse techniques. An increasing number of cases of the "position effect," that is, effects upon the genetic system attributable not to genic differences but to differences in the spatial relations of the genes, was reported. This led R. Goldschmidt to suggest the possibility that all mutations are position effects and that indeed, such effects might account for all hereditary modifications in the chromosome. Most geneticists, however, preferred the view that mutations arise as definite rearrangements within the molecule while recognizing, however, that many socalled mutations are actually minute deficiencies or rearrangements in the chromosome. The intensive study of viruses led to many comparisons between the virus and the gene based originally on the similarity in self-reproducing ability in the two. The X-ray dosage inactivation curves were also shown to be similar, and chemical investigations revealed that the reproduction of both is associated with nucleoproteins.

There was much interest during the decade in studies of haploid and polyploid animals produced as a result of parthenogenetic development. G. Pincus and his co-workers carried out experiments in which rabbit eggs were artificially activated and after implantation in the uterus went on to develop to give normal living female rabbits. Breeding experiments with the females so produced indicated that these individuals were diploid, despite their parthenogenetic origin, the diploid condition probably arising by fusion of the chromosomes produced at the second maturation division. T. Kawamura investigated the chromosomal condition in parthenogenetic frogs and found that though most of these were haploids many were diploids or triploids. The formation of the diploids was apparently the result of suppression of the first cleavage but the triploids seem to have been produced by fusion of three of the sets of chromosomes formed during meiosis. G. Fankhauser produced haploidy and polyploidy in amphibians by subjecting the eggs to various treatments such as exposure to cold or heat shortly before fertilization. The nucleoplasmic ratio in such animals was found to be constant, and the body size was affected in the haploids only. The developmental rate and viability of haploids was lower than normal, but the viability of triploids appeared normal. This material shed light upon the problem of sex determination in amphibia for the sex conditions in the triploids indicated that, in the newt, the female sex is heterogametic.

A new field of genetic investigation was opened with the discovery by T. M. Sonneborn, in 1937, of mating types in the ciliate protozoan, *Paramecrum aurelia*. It was found that the individuals of this species fall into three groups, the members of which, when mixed, do not conjugate with each other. However, within each group there are two

Flamingos (left foreground), snowy egrets and other tropical American birds at the Lincoln Park zoo in Chicago, Ill., where tropical plants and spanish moss were used in outdoor cages for the first time in 1946

mating types, and when clones consisting of these two types are mixed they clump together in large masses from which conjugating pairs later emerge. H. S. Jennings found a similar but more complex situation in *Paramecium bursaria* in which there are as many as eight different mating types within a single group. Conjugation will occur between any two of the eight types but not within a single type. Sonneborn showed that it is the macronucleus which determines the mating type and there is considerable evidence for attributing the mating type to a mutable gene.

A new approach to the study of the mode of action of genes was found in the work of D. F. Poulson, who followed the developmental history of Drosophila eggs in which there were known deficiencies in the X chromosome. All these deficiencies were lethal, but the exact stage at which development became abnormal differed, depending on the extent and location of the deficiency. Thus in the complete absence of the X chromosome, abnormality was observed during early cleavage. Lack of half the X chromosome affected blastoderm formation or separation of the germ layers depending upon which half was missing. Smaller defects in specific regions of the chromosome affected specific processes; for example, the deficiency "Notch-8" resulted in failure in mesoderm differentiation and abnormalities in the nervous system. This work indicated that individual genes directly control particular events in development, although this point was not definitely proved at the end of the decade.

Another lethal effect, that found in the homozygous "Creeper" fowl, was investigated in a series of studies by V. Hamburger and was found to be due to abnormalities in development of the splanchnic mesoderm which result in inhibition of the yolk-sac circulation.

An outstanding example of a research which contributed to knowledge in several of the main fields of zoology and provided an important integration of genetics, development and biochemistry was the study of the differentiation of eye colour in the fruit-fly. This investigation, which had its beginning in 1935, produced extremely significant results due to the carefully planned and executed experiments of B. Ephrussi and his co-workers in Paris and of G. W. Beadle and his collaborators in California. The normal wild fruit-fly has brownish-red eyes, but it has long been known that various other eye colours are produced in flies having certain recessive genes. The eyes develop embryonically from the optic imaginal discs of the larva and first become pigmented during the pupal stage. Ephrussi and Beadle devised a method by which these eye discs could be transplanted from one larva to another. They found that, when the eye-discs of different eye-colour mutants are transplanted into wild-type hosts, certain of these mutants, namely "vermilion" and "cinnabar," differentiate into wild-type eyes instead of giving their characteristic colour. Further transplants indicated that this results from the presence, in the lymph of the host, of two different substances (designated v+ and cn+) which cause the change from vermilion to wild-type and from cinnabar to wild-type respectively. Transfusions of lymph from one larva to another and the preparation of active extracts from the lymph confirmed this idea. Feeding experiments indicated that tryptophane is in some way related to the v+ substance and finally, through the work of A. Butenandt and his collaborators in Berlin the v+ substance was identified as kynurenine, a tryptophane derivative. The cn' was known to be itself a derivative of the ${
m v}^{\scriptscriptstyle {\rm T}}$ substance but its exact chemical nature was still unknown at the end of the decade. It is probable that this method of eye-colour determination occurs generally in insects, for A. Kuhn, E. Caspari and E. Plagge found a similar situation in the moth *Ephestia*.

Animal Behaviour.—Several studies of the migratory behaviour of different animals are noteworthy. The migration of butterflies was investigated by C. B. Williams, G. F. Cockbill, M. E. Gibbs and J. A. Downes by means of tagging experiments carried out in England. The migration and spawning of the salmon was studied and reviewed by E. B. Powers, who found evidence that the carbon dioxide concentration in the water is a controlling factor. A comprehensive book by C. Elton presented an account of the population cycles and mass movements in certain small rodents. C. S. Chadwick found that the migration of newts from land to water in the autumn could be influenced by injections of prolactin or pituitary extracts.

Studies of the "social hierarchy" in the fowl were extended by the finding of W. C. Allee, N. Collias and C. Z. Lutherman, that the "pecking order" in a group of hens may be modified by injecting the birds which stand low in the hierarchy with the male hormone, testosterone. Such individuals then become increasingly pugnacious and rise to dominant positions. Similar results were obtained in experiments on certain fishes.

The long-discussed problem of the mechanism by which flying bats are able to avoid obstacles in the dark was solved by the ingenious experiments of D. R. Griffin and R. Galambos who showed that the bat, during flight, is continuously emitting supersonic cries and that its obstacle-avoidance results from its ability to accurately localize objects by perception of the reflected supersonic waves.

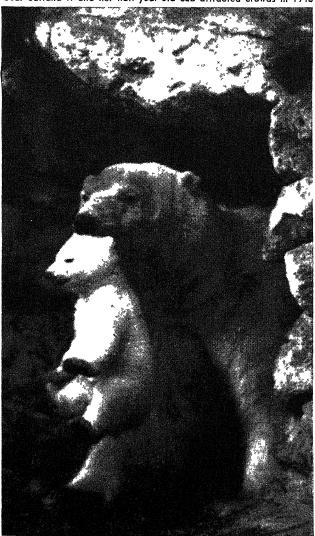

Morphology and Evolution.-A number of important studies of the phylogeny of specific animal groups appeared during this period. Among these may be mentioned the monograph of W. Garstang and R. Gurney on the relationships of the trilobites and crustacea, R. E. Snodgrass' review of the phylogeny of the annelids and arthropods and the extensive study of T. Dobzhansky and C. Epling on the taxonomy and interrelationships of the races of Drosophila pseudobscura. Several fossil groups of particular interest in relation to vertebrate evolution became better known through monographic treatment. The most primitive of the vertebrates with movable jaws, the Acanthodian fishes, were studied by D. M. S. Watson. E. C. Olson discussed the structure of the mammal-like reptiles, and found indications that the early mammals may have originated from several reptilian stocks rather than a single one. R. Broom continued his extensive studies of the manlike apes of the Pleistocene of South Africa. In relation to studies of fossil groups, the discovery in 1939 in the deep waters off South Africa, of a living coelacanth fish was noteworthy. The animal is a member of a group previously known only from fossil forms. The phylogeny of the musculature of the tetrapod limb was elucidated by morphological studies on various vertebrate types by A. B. Howell and by A. S. Romer.

A study of cave fishes of Mexico by C. M. Breder, Jr. and Z. B. Gresser was of interest since the authors found a complete gradation from blind, eyeless fishes to normal individuals. The blind individuals showed a definite avoidance of light, despite the absence of eyes, and this was considered an important factor in the segregation of the cave forms. Beadle investigated the problem of osmotic regulation in the body fluid of aquatic animals in relation to the adjustments necessary in passing from marine to freshwater habitats.

The use of serological techniques in the study of relationships became of increasing value. H. P. Levine and P. A. Moody, using this method with rodents, found that the serological relationships follow closely the accepted classification on the basis of morphology. R. W. Wilhelmi utilized precipitin tests in studying the relationships of echinoderms, arthropods, annelids and prochordates, and found corroboration for the generally accepted theory of echinoderm ancestry for the prochordates. R. W. Cumley applied the complement fixation method to investigate the taxonomy of *Drosophila*. M. M. Mahr found the serological technique sufficiently delicate to detect species differences in tapeworms.

Zoological Gardens.-The decade saw far-reaching changes in concepts of zoological gardens in the United States. The hampering effects of building restrictions prevented extensive physical changes but provided a muchneeded opportunity for reconsideration of underlying philosophies and means for giving them effective expression. Previously the aim of every such institution had been to exhibit a series of living creatures as extensive as its facilities would allow. Ranking was accorded almost solely on the basis of the number of species included in collections. The enforced pause in building operations, coupled with nearly complete cessation of the importation of fresh specimens, gave time for thought. The result was a sweeping revision of understanding of the functions of the zoological garden in its relation to the public. Fewer animals to exhibit brought realization that there was no merit in mere numbers. The necessity for preserving existing specimens brought marked improvements in the techniques of animal care, breeding and exhibition.

Realization that the primary purpose of the zoological garden is to arouse interest in natural history and to meet the resulting desire for information with factually cornect material, resulted in several definite advances. Further development of the printed label, probably first used at the Zoological Garden of Philadelphia, resulted in improved readability and better utilization of space. Carefully done illustrations in colour added greatly to readiness of identification. Larger labels, giving the story behind especially notable exhibits, were used to great advantage. This effort resulted in a flood of requests for further information. In the New York Zoological park, the reaction was met by the installation of a Question house, where trained attendants answered thousands of inquiries annually.

To satisfy the need for a means to encourage the natural interest of children in animals, a "Baby Pet zoo" was opened in the Philadelphia Zoological garden in 1938 and a "Children's zoo" in the New York Zoological park in 1941. Here children were allowed to come into contact with tame, living animals. Since this was often a first experience, carefully selected personnel maintained close and constant supervision.

In the exhibitional field, important advances were made. Many plans remained in the drawing stage, yet there was enough actual construction to establish the general soundness of ideas. The moated, barless area, originally devised by Carl Hagenbeck in 1907 and later used by several U.S. gardens, was seen in improved form in the African plains opened in the New York Zoological park in 1941. Further development of this idea, on an extensive scale, was indicated in the plans of many institutions.

The most revolutionary idea in exhibitional technique had to do with those creatures which must be shown indoors. The use of glass-fronted enclosures, naturally or artificially lighted and viewed from a darkened space to avoid disturbing reflections, had had limited use for public aquariums and for the exhibition of reptiles. However, it was not fully applied to warm-blooded creatures until the opening of the Jewel room in the New York Zoological park in 1945. Here, brilliantly coloured birds were shown with excellent effect against a carefully arranged background of tropical planting. A similar plan was developed for the anthropoid apes and small mammals in the same institution. Animals and public were fully in-

sulated from each other, to mutual advantage. The use of fluorescent lighting made this development possible, since a negligible degree of heat was generated.

Isolation from world sources of supply during most of the decade resulted in intensified efforts on the part of U.S. zoological gardens to increase the animals in hand and brought about the foundation of breeding stocks of many kinds. The zoological gardens of Chicago (Brookfield) and St. Louis were especially successful with various species of antelopes. The San Diego Zoological garden had notable results with monkeys and numerous birds. Deer, wild cattle and antelopes were well established in the New York Zoological park, where the rare wattled crane of Africa was bred in captivity for the first time in 1945.

In a decade marked by a paucity of animal importations into the United States it was remarkable that the few arrivals should number several great rarities. Giant pandas came from China to the zoological gardens of Chicago, St. Louis and New York. The first and only okapi to be seen in the U.S. was received at the New York Zoological park in 1937. The first specimens of the very rare Pere David's deer arrived in New York in Dec. 1946. Among birds, rarities included the quetzal, the umbrella bird, the scarlet cock of the rock and the emperor penguin, the latter at the National Zoological park in Washington.

(L. S. C

During World War II, zoos—not only in Europe but all over the world—suffered from general depletion of their collections owing to the impossibility of obtaining new specimens from other countries to replenish the normal losses incurred by old age and sickness. In addition, many of the zoos in the immediate theatre of war suffered severely from the many and varied forms of destruction which the war produced.

Of the European zoos in the immediate war zone, that of Antwerp suffered severely in the final stages from flying bombs. The Rotterdam gardens, which had been moved from the centre of the city to the suburb of Blijdoorp, escaped the fate of the city in 1940. The gardens at Amsterdam also escaped. The intensive bombing of German cities by the British and U.S. air forces resulted in the destruction of several of the most famous of the German zoos. The Berlin zoo was reduced to ruins and the Hamburg, Hanover and Munich zoos were considerably damaged. In Paris both the Jardin des Plantes and the new zoo at Vincennes, with its amazing structures, escaped damage, but the Jardin d'Acclimatation was used as a barracks by the nazi troops, who did much wanton damage there.

In spite of the many wartime difficulties, the London zoo remained open throughout World War II, providing entertainment, relaxation and education for many thousands of war workers and members of British and Allied forces, who were admitted at specially reduced rates. From Sept. 1939 to the cessation of hostilities in Europe in May 1945, visitors to the London zoo numbered 6,500,000. During the bombing of London in 1940–41, the zoo at Regent's park received 26 direct hits from high-explosive bombs and upward of 400 incendiary bombs. In 1944 even greater damage was caused by flying bombs, one of which fell in the centre of the gardens and was responsible for an enormous

amount of material damage, though fortunately little loss of life. In Aug. 1940 the council of the Zoological society of London revised the rule whereby Sundays were reserved for fellows of the society. The gardens were opened to the public in the afternoon and it was decided to continue this practice indefinitely.

Whipsnade park, the society's new venture which was completed in 1931, also remained open throughout World War II, with the exception of the winter months of 1939-40. The elephants from London were sent there for safety and also the famous giant panda "Ming," one of the first specimens of this rare animal to be shown alive in Europe. Another rare animal in the London zoo at the outbreak of war was the okapi, which had been presented in 1937 by the Belgian king to King George VI. It was decided in this case that the risk of moving the animal from London to Whipsnade was greater than the risk of bombing, and fortunately it survived. Visitors to Whipsnade park during the war numbered approximately 1,250,ooo. Before the war the average annual attendance was 500,000. The considerable falling off in numbers was due to the rationing of gasoline which made it difficult for visitors to make the 30-mi. journey from London.

At the outbreak of World War II, the aquarium and reptile house in the London zoo were closed, and all the poisonous snakes were destroyed. This was a fortunate precaution. as a high-explosive bomb later fell in the aquarium's freshwater hall and the glass of the reptile house dens was shattered by a flying bomb. The children's zoo, introduced during the secretaryship of Dr. Julian Huxley, was closed in 1939 but re-opened in 1944 and continued to prove a great attraction to young visitors.

Dr. Huxley's predecessor, Sir Peter Chalmers Mitchell, who was the society's secretary from 1903 to 1935 and was responsible for many innovations in the keeping of animals in captivity and for the formation of Whipsnade park, died as the result of an accident in July 1945.

In spite of paper restrictions and printing difficulties, the Zoological society of London continued its scientific meetings and publications throughout World War II, although both meetings and scientific papers submitted were reduced in number. The replanning of the Regent's park gardens, which was started in 1939 with the proposed construction of a new elephant house, had to be postponed. The rebuilding of the elephant house on the old site was abandoned.

The zoos at Bristol, Edinburgh and Chester came through the war unscathed but with their collections much depleted. The outstanding exhibit at the Bristol zoo during this period was the male gorilla "Alfred" which was 18 years old in 1946 and considered to be the finest gorilla in captivity anywhere. In addition to the above-mentioned zoos which were run by private societies and were non-profit-making, the zoos at Manchester, Dudley, Chessington and Maidstone remained open through World War II (See also Endocrinology; Entomology; Genetics; Marine Biology; Palaeontology; Physiology.)

INDEX

INDEX

This index gives the exact location of information to be found in *Ten Eventful Years* by volume, page and section of the page. The section of the page is indicated by the letters "a," "b," "c" and "d," signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column. Thus, 4 365c indicates that the information will be found in volume 4, page 365, top half of the second column.

Information dealing with the subject as a whole is given first after the main entry. Secondary entries are indented and follow the main entry alphabetically, each giving page reference to specific information. Cross references are to the index only.

A page number in italic type indicates an entire article on the subject. A page number with "fol" after it indicates that other references to the subject follow within the same article. References to pictures are indicated by "illus"

All index entries whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac", "St" is treated as "Saint", "Mt" as "Mount"
